Abstract

Eriophyoid mites from Qinghai Province, northwestern China were studied herein. Up to now, only six species have been reported from Qinghai Province. In field surveys, 17 eriophyoid mite species were collected, among which nine species were found new to science. The new species and their host plants are listed as follows: *Acaphyllisa tuberculumae* sp. n. on *Populus* sp. (Salicaceae); *Projectus xiningensis* sp. n. on *Pinus* sp. (Pinaceae); *Phyllocoptes beishaniensis* sp. n. on *Spiraea mongolica* Maxim. (Rosaceae); *Tetra pruniana* sp. n. on *Prunus tomentosa* Thunb. (Rosaceae) Rupr. (Berberidaceae); *Tetra pyriana* sp. n. on *Pyrus calleryana* Decne. (Rosaceae); *Tetra simonia* sp. n. on *Populus simonii* Carr. (Salicaceae); *Diptacus berberinus* sp. n. on *Berberis amurensis* Rupr. (Berberidaceae); *Diptacus mengdaensis* sp. n. on *Lonicera elisae* Franch. (Caprifoliaceae); *Rhyncaphyoptus spinus* sp. n. on *Lonicera rupicola* Hook. f. et Thoms. (Caprifoliaceae). *Aculops ulmi* Hong & Xue, 2005 was re-described.

Introduction

Qinghai Province ($89^{\circ}35' E$ – $103^{\circ}04' E$, $31^{\circ}39' N$ – $39^{\circ}19' N$), located in the northwest of the People's Republic of China, is a part of the Qinghai-Tibet Plateau, with an average elevation of over 3000m (1650m–6860m). The average temperature ranges from $0.4^{\circ}C$ to $7.4^{\circ}C$. (Qinghai Province Government Website).

Up to now, six species of eriophyoid mites from Qinghai have been reported. They are *Aceria paramacrodonis* Kuang, 1988 on *Lycium* sp. (Solanaceae), *Aceria qinghaiensis* Kuang, 1997 on *Salix babylonica* L. (Salicaceae), *Aculodes salicis* Kuang, 1997 on *Salix babylonica* L. (Salicaceae), *Aculops xiningensis* Kuang, 2000 on *Malus pumila* P. Mill. (Rosaceae), *Aculus huangzhongensis* Kuang, 2000 on *Syringa oblata* Lindl. (Oleaceae) and *Tetrastinus syringae* Lin & Kuang, 2001 on *Syringa oblata* Lindl. (Oleaceae). In July 2007, field surveys were conducted in Qinghai Province, northwestern China. Twenty-five eriophyoid mite samples were collected and 17 eriophyoid mite species were identified, among which nine species were found new to science. No species reported earlier from Qinghai were collected in this survey. In total, there are 23 species of the Eriophyoidea from Qinghai Province, belonging to two families and 12 genera. A list of eriophyoid mites from Qinghai Province is given (Table 1).

Materials and methods

In the field, eriophyoid mites were collected by the aid of a hand-lens (30X) from the lower surface of host plant leaves. Eriophyoid mites, together with host plants, were immersed in 75% alcohol and kept in vials. Each vial was marked with the collection data, such as specimen number, collection date, host plant, mite color, location, collector, and mite relationship to host plant. The collection data were also recorded in the collection notebook for further use. The host plants were kept in a plant specimen folder in a dry environment.

The morphological terminology used here follows that of Lindquist (1996) and the generic classification was made according to Amrine et al. (2003). Slides were mounted using Keifer's F-medium and modified Berlese medium (Amrine and Manson 1996). Specimens were measured based on the methods outlined by de Lillo et al. (2010). Specimens were examined with a Zeiss A2 (Germany) research microscope with phase contrast and semi-schematic drawings were made. Photos of slide mounted mites were taken with the same microscope (100 \times oil immersion objective with 10 \times eyepieces), connected to a computer using Axiovision image analysis software. For each species, the holotype female measurement precedes the corresponding range for paratypes (given in parentheses). All measurements are in micrometres (μm), and are lengths when not otherwise specified. All the type materials are deposited at Arthropod/Mite collection of, the Department of Entomology, Nanjing Agricultural University, Jiangsu Province, China.

Setae *h1* 2, *h2* 60. **Male genitalia** forming a “Y” like structure in the middle, 19 wide, setae *3a* 22, 15 apart.

Type material. **Holotype**, female (slide number NJAUEri789B, marked Holotype), from *Populus* sp. (Salicaceae), Xining City, Qinghai Province, P. R. China, 36° 38'18"N, 101°45'27"E, elevation 2241m, 21 July 2007, coll. Xiao-Feng Xue. **Paratypes**, 7 females and 1 male (slide number NJAUEri789B), with the same data as holotype.

Relation to host. Vagrant on leaf lower surface. No damage to the host was observed.

Etymology. The specific designation *tuberculumae* is from the character of dorsal opisthosomal microtubercles, "tuberculum" in Latin; masculine in gender.

Differential diagnosis. This species is similar to *Acaphyllisa populi* Xue & Hong, 2006, but can be differentiated from the latter by prodorsal shield with six cells in the middle (prodorsal shield without cells in *A. populi*), opisthosoma dorsally with round microtubercles (opisthosoma dorsally with elliptical microtubercles only on ridges in *A. populi*), female genitalia coverflap smooth (female genital coverflap with 10 longitudinal ridges in *A. populi*).

Scapular tubercles ahead of rear shield margin, 2 (2–3), 22 (21–22) apart, scapular setae (*sc*) 10 (8–11), projecting centrad. **Coxigenital region** with 5 (4–5) smooth annuli. Coxisternal plates smooth, anterolateral setae on coxisternum I (*1b*) 8 (7–8), 13 (13–14) apart, proximal setae on coxisternum I (*1a*) 21 (17–21), 10 (10–11) apart, proximal setae on coxisternum II (*2a*) 42 (42–45), 30 (30–31) apart, tubercles *1b* and *1a* 9 (9–10) apart, tubercles *1a* and *2a* 10 (10–11) apart. Prosternal apodeme combined 6 (6–7). **Leg I** 33 (33–34), femur 11 (10–11), basiventral femoral seta (*bv*) 12 (12–13); genu 6 (5–6), antaxial genual seta (*l'*) 23 (22–23); tibia 8 (8–9), paraxial tibial seta (*l*) 7 (6–7), located at 1/3 from dorsal base; tarsus 6 (6–7), seta *ft'* 18 (18–19), seta *ft''* 22 (22–23), seta *u'5* (5–6); tarsal empodium (*em*) 8 (8–9), simple, 6-rayed, tarsal solenidion (*ω*) 7 (6–7), knobbed. **Leg II** 31 (29–31), femur 10 (10–11), basiventral femoral seta (*bv*) 10 (9–10); genu 6 (5–6), antaxial genual seta (*l'*) 10 (8–10); tibia 6 (6–7); tarsus 6 (6–7), seta *ft'7* (6–7), seta *ft''21* (21–22), seta *u'5* (5–6); tarsal empodium (*em*) 8 (8–9), simple, 6-rayed, tarsal solenidion (*ω*) 8 (8–9), knobbed. **Opisthosoma** dorsally with 45 (45–53) annuli, smooth; ventrally with 52 (51–52) annuli, with round microtubercles. Setae *c2* 30 (29–30) on ventral annulus 10 (9–13), 55 (54–55) apart; setae *d* 60 (55–60) on ventral annulus 20 (19–20), 30 (30–31) apart; setae *e* 40 (40–45) on ventral annulus 31 (30–31), 15 (15–16) apart; setae *f* 25 (25–27) on ventral annulus 46 (45–46), 24 (24–25) apart. Setae *h1* 5 (4–5), *h2* 80 (80–85). **Female genitalia** 17 (17–18), 22 (22–23) wide, coverflap with 10 longitudinal ridges, setae *3a* 56 (55–56), 16 (16–17) apart.

Male. ($n = 9$) Body fusiform, light yellow, 169–195, 56–67 wide. **Gnathosoma** 19–22, projecting obliquely down, suboral plate present, pedipalp coxal seta (*ep*) 4–5, dorsal pedipalp genual seta (*d*) 6–7, cheliceral stylets 17–18. **Prodorsal shield** has the same design as female, 42–50, 49–56 wide, subtriangular; frontal lobe 8–9. Scapular tubercles ahead of rear shield margin, 2–3, 18–19 apart, scapular setae (*sc*) 8–9, projecting centrad. **Coxigenital region** with 5 smooth annuli. Coxisternal plates smooth, anterolateral setae on coxisternum I (*1b*) 5–6, 12–15 apart, proximal setae on coxisternum I (*1a*) 13–14, 10–11 apart, proximal setae on coxister-

Setae h1 4–5, h2 42–45. **Male genitalia** 19–21 wide, setae 3a 13–14, 17–19 apart.

Type material. **Holotype**, female (slide number NJAUEri815, marked Holotype), from *Spiraea mongolica* Maxim. (Rosaceae), Beishan National Forest Park, Huzhu County, Qinghai Province, P. R. China, 36°53'35"N, 102°25'56"E, elevation 2610m, 22 July 2007, coll. Xiao-Feng Xue. **Paratypes**, 7 females and 2 males (slide number NJAUEri815), with the same data as holotype.

Relation to host. Vagrant on leaf lower surface.

Etymology. The specific designation *beishaniensis* is from the place name Beishan National Forest Park, where the new species were collected; feminine in gender.

Differential diagnosis. This species is similar to *Phyllocoptes adalius* (Keifer, 1939) from *Rosa* sp., but can be differentiated from the latter by prodorsal shield front lobe stout (prodorsal shield front lobe pointed in *P. adalius*), dorsal opisthosoma annuli smooth (opisthosoma annuli entirely covered with spinuliferous microtubercles in *P. adalius*), Coxisternal plates smooth (coxisternal plates with short lines in *P. adalius*).

Relation to host. Vagrant on leaf lower surface. No damage to the host was observed.

Etymology. The specific designation *pruniana* is from the generic name of host plant, *Prunus*; feminine in gender.

Differential diagnosis. This species is similar to *Tetra pinnatifidae* Xue, Song & Hong, 2006a, but can be differentiated from the latter by median and submedian lines absent (median and submedian lines present in *T. pinnatifidae*), admedian lines connected by two weak transverse lines (admedian lines separated in *T. pinnatifidae*).

Type material. Holotype, female (slide number 783, marked Holotype), from *Berberis amurensis* Rupr. (Berberidaceae), Mengda Natural Reserve, Xunhua County, Qinghai Province, P. R. China, 35° 47' 38" N, 102° 40' 40" E, elevation 2523m, 19 July 2007, coll. Xiao-Feng Xue. **Paratypes**, 8 females and 1 male (slide number 783), with the same data as holotype.

Relation to host. Vagrant on leaf lower surface. No damage to the host was observed.

Etymology. The specific designation *berberinus* is from the generic name of host plant, *Berberis*; masculine in gender.

Differential diagnosis. This species is similar to *Diptacus maddenis* Song, Xue & Hong, 2007a, but can be differentiated from the latter by opisthosomal dorsal annuli smooth (opisthosomal dorsal annuli with elongated microtubercles in *D. maddenis*), female genital coverflap with short lines at the base (genital coverflap with granules in *D. maddenis*), tarsal empodium 7-rayed (4-rayed in *D. maddenis*).

Discussion

Although Qinghai has climate, vegetation and biological diversity similar to Tibet, we did not find any eriophyoid mite species already reported in Tibet (Song et al. 2011). On the contrary, 6 of 23 species were reported from Gansu Province or Shaanxi Province, east neighboring provinces. As of 2010, 932 eriophyoid mite species have been described from China (Hong et al. 2010), and the number is still increasing. Qinghai has about 8% of the land of China, but only about 2% eriophyoid mites were reported to date. Furthermore, only two investigations have been conducted. More systematic collections of eriophyoid mites from Qinghai Province are needed in the near future.
