## Abstract

In this monograph on the Indochinese species of *Tetraserica* Ahrens, 2004 all species distributed in Thailand, Laos, Vietnam, Cambodia, Myanmar, and mainland Malaysia are covered as well as those of the Indian province Mizoram. From this revision, the following new combinations result: *Tetraserica gressitti* (Frey, 1972), **comb. n.**, *T. laotica* (Frey, 1972), **comb. n.**, *T. satula* (Brenske, 1898), **comb. n.**, *T. sejugata* (Brenske, 1898), **comb. n.**, *T. siantarensis* (Moser, 1922), **comb. n.**, *T. spinicrus* (Frey, 1972), **comb. n.**, *T. vietnamensis* (Frey, 1969), **comb. n.**, and *T. wapiensis* (Frey, 1972), **comb. n.**. Two new synonyms were found: *Tetraserica midoriae* Kobayashi, 2017 (**syn. n.**) = *T. laotica* (Frey, 1972); *T. graciliforceps* Liu et al. 2014 (**syn. n.**) = *T. satula* (Brenske, 1898). The lectotypes of *Tetraserica gestroi* (Brenske, 1898), *T. miniatula* (Moser, 1915), and *T. siantarensis* (Moser, 1922) are designated. 116 *Tetraserica* species were recorded from Indochina, among which 88 new species are described: *Tetraserica allochangshouensis* sp. n., *T. allomenegeana* sp. n., *T. allosejugata* sp. n., *T. angkorthomensis* sp. n., *T. angkorwatensis* sp. n., *T. appendiculata* sp. n., *T. auriculata* sp. n., *T. bachmaensis* sp. n., *T. banhuaiopensis* sp. n., *T. bansanpakiana* sp. n., *T. bolavensis* sp. n., *T. breviforceps* sp. n., *T. cattienensis* sp. n., *T. champaassakana* sp. n., *T. constanti* sp. n., *T. cucphongensis* sp. n., *T. curviforceps* sp. n., *T. desalvazzai* sp. n., *T. doiphukhaensis* sp. n., *T. doipuiensis* sp. n., *T. doisuthepensis* sp. n., *T. dongnaiensis* sp. n., *T. falciforceps* sp. n., *T. falciformis* sp. n., *T. feresiantarensis* sp. n., *T. filiforceps* sp. n., *T. fulleri* sp. n., *T. phukradungensis* sp. n., *T. geiserae* sp. n., *T. giulianae* sp. n., *T. infida* sp. n., *T. jakli* sp. n., *T. khaosoidaoensis* sp. n., *T. kiriomensis* sp. n., *T. koi* sp. n., *T. kollae* sp. n., *T. konchurangensis* sp. n., *T. kontumensis* sp. n., *T. loeiensis* sp. n., *T. lucae* sp. n., *T. microfurcata* sp. n., *T. microspinosa* sp. n., *T. multiangulata* sp. n., *T. nahaeoensis* sp. n.,

*T. nakaiensis* sp. n., *T. namnaoensis* sp. n., *T. neouncinata* sp. n., *T. nonglomensis* sp. n., *T. nussi* sp. n., *T. olegi* sp. n., *T. pahinngamensis* sp. n., *T. pailinensis* sp. n., *T. parasetuliforceps* sp. n., *T. paratonkinensis* sp. n., *T. petrpacholatkoi* sp. n., *T. phatoensis* sp. n., *T. phoupanensis* sp. n., *T. pluriuncinata* sp. n., *T. pseudoliangheensis* sp. n., *T. pseudoruiliensis* sp. n., *T. pseudouncinata* sp. n., *T. quadriforceps* sp. n., *T. quadrifurcata* sp. n., *T. rihai* sp. n., *T. romae* sp. n., *T. rubrithorax* sp. n., *T. sapana* sp. n., *T. semidamadiensis* sp. n., *T. semipingjiangensis* sp. n., *T. semiruiliensis* sp. n., *T. semishanensis* sp. n., *T. setuliforceps* sp. n., *T. shanensis* sp. n., *T. smetsi* sp. n., *T. margheritae* sp. n., *T. soppongana* sp. n., *T. spanglerorum* sp. n., *T. spinotibialis* sp. n., *T. subrotundata* sp. n., *T. tanahrataensis* sp. n., *T. thainguyensis* sp. n., *T. trilobiforceps* sp. n., *T. ululalatensis* sp. n., *T. umphangensis* sp. n., *T. vari* sp. n., *T. veliformis* sp. n., *T. vientianeensis* sp. n., and *T. xiengkhouangensis* sp. n. A key to the Indochinese *Tetraserica* species is given and distributions as well as the habitus and male genitalia of all species are illustrated.

## Introduction

While the genus *Tetraserica* Ahrens, 2004 included earlier only species from Indian subcontinent and Myanmar, Liu et al. (2014) added a significant number of species from China and recently additional species were described by Ahrens and Fabrizi (2016) from northeastern India and by Kobayashi (2017, 2018) from Thailand. Several molecular phylogenetic analyses confirmed the monophyly of *Tetraserica* (Ahrens & Vogler, 2008; Liu et al. 2015; Eberle et al. 2016). Based on a thorough examination of all type material of Asian mainland Sericini and an assessment of DNA-informed species boundaries (Dalstein et al. 2019) we revise here the taxonomy of the *Tetraserica* species so far known from Indochina. We found 88 new species, which are described herein. A key to the Indochinese *Tetraserica* species is given, and their distributions, as well as habitus and male genitalia, are illustrated.

## Materials and methods

The terminology and methods used for measurements, specimen dissection, and genital preparation follow Ahrens (2004). Data from specimens examined are cited in the text with original label contents given in quotation marks, multiple labels are separated by a “/”. Male genitalia were glued to a small pointed card attached to the specimen. Descriptions and illustrations of new taxa are based on the holotype or lectotype

specimen, while the variation of other specimens is given separately. All descriptions and measurements were made under an Olympus SZX 12 microscope, and all genital and habitus illustrations were made with a digital camera (AxioCam HRc) attached to a stereo microscope (Zeiss Stereo Discovery V20) and Axio Version 4.8 software. The distribution maps were generated using Q-GIS 2.0.1 and Inscape software.

Type specimens and other examined material are deposited in the following institutions or collections:

<b>BPBM</b>	Bernice P. Bishop Museum, Honolulu (Hawai), USA;

## Taxonomy

### *Tetraserica* Ahrens, 2004

*Tetraserica* Ahrens, 2004: 168 (type species by original designation: *Neoserica gestroi* Brenske, 1898); Liu et al. 2014: 83; Ahrens and Fabrizi 2016: 122; Kobayashi 2017: 33, 2018: 57.

**Diagnosis.** Body moderately large to large (6–12 mm), mostly dark brown; ventral surface reddish brown; dorsal surface dull and glabrous.

Labroclypeus subtrapezoidal, wider than long, widest at base, lateral margins moderately convex and convergent to strongly rounded anterior angles, anterior margin weakly sinuate medially, margins moderately reflexed; surface weakly convex, moderately shiny, finely and densely punctate; frontoclypeal suture indistinctly incised, flat and weakly curved medially; ocular canthus short and triangular, impunctate, with a single terminal seta. Frons dull, with sparse, fine punctures, with single erect setae beside each eye. Antenna yellowish, with ten antennomeres; club composed of four antennomeres in male, straight, rarely longer than 1.5 times as the remaining antennomeres combined; club in female composed of three antennomeres, as long as the remaining antennomeres combined. Mentum elevated and slightly flattened anteriorly.

Pronotum moderately wide and strongly convex, lateral margins evenly convex, more strongly narrowed anteriorly towards sharp and slightly produced anterior angles. Anterior margin of pronotum slightly convex, with fine complete marginal line. Posterior angles blunt or strongly rounded. Surface finely and densely punctate, except minute setae glabrous, lateral and lateral anterior margins sparsely setose. Hypomeron not carinate. Scutellum triangular, finely and densely punctate.

Elytra oblong, widest just behind middle, striae distinctly impressed, finely and moderately densely punctate, intervals distinctly convex, with coarse and dense punctures concentrated along striae, with very minute setae in punctures; epipleural edge robust, ending at weakly curved and slightly blunt external apical angle of elytra, epipleura densely setose, apical border with a broad fringe of microtrichomes (100 $\times$ ).

Ventral surface weakly shiny, finely and densely punctate, metasternum sparsely covered with fine, short, or very minute setae, metacoxa glabrous, with a few single setae laterally; abdominal sternites finely and densely punctate, with a transverse row of coarse punctures, each bearing a robust seta. Mesosternum between mesocoxae as wide as mesofemur. Pygidium weakly convex and dull, densely punctate, without smooth midline, almost glabrous, but with a few longer setae along apical margin; pygidium without strong sexual dimorphism.

Legs moderately wide; femora finely and sparsely punctate; metafemur wide and moderately shiny or dull, anterior margin acute, posterior margin smooth ventrally and only weakly widened in apical half, posterior margin smooth dorsally, with a few short setae basally. Posterior margin of metafemur generally straight or slightly convex. Metatibia moderately wide to wide and moderately long, widest at half of metatibial

length, dorsal margin sharply carinate, with two groups of spines; lateral face finely and sparsely punctate; ventral edge finely serrated, with four robust equidistant setae, medial face smooth, apex anteriorly near tarsal articulation with a shallow sinuation. Tarsomeres with fine, very dense setae ventrally on distal half, neither laterally nor dorsally carinate, dorsally smooth; metatarsomeres with a strongly serrated ridge ventrally and glabrous; first metatarsomere slightly shorter than two following tarsomeres combined, one third of its length longer than dorsal tibial spine. Protibia short, bidentate; anterior claws symmetrical, basal tooth of both claws bluntly truncate at apex.

Aedeagus: Phallobase with a more or less long median ventral extension (median phallobasal lamina).

**Remarks.** *Tetraserica* differs from closely related genera, *Microserica* Brenske, 1894 and *Trioserica* Moser, 1922, by lacking the ventral carina on hypomeron. From *Microserica* it also differs by lacking the sexual dimorphism of the pygidium, from *Trioserica* by the bidentate protibia. In contrast to the *Microserica*, species of *Tetraserica* are active at night and are attracted by light.

**Distribution.** The genus is distributed almost in the entire Oriental region except the southern Indian subcontinent; we know that additional species described by various authors are so far assigned to “*Neoserica*” from Philippines, Sumatra, and Borneo but that awaits a formal revision (Ahrens 2004).

#### Key to Indochinese species of *Tetraserica* Ahrens, 2004 (based on males):

—	Right paramere weakly bent at middle (lateral view) .....	
—	.....	<i>T. masumotoi</i>
19	Median lamina of phallobase short, distinctly shorter than phallobase .....	20
—	Median lamina of phallobase long, at least subequal to length of phallobase .....	
—	.....	82

- 20 Median lamina of phallobase medium in length, approx. three quarter of phallobase length ..... 21  
– Median lamina of phallobase short, subequal to at maximum half of length of phallobase ..... 37  
21 Right paramere at base without spines ..... 22  
– Right paramere at base with a comb of short spines ..... *T. quadriforceps* sp. n.  
22 Right paramere simple ..... 23  
– Right paramere with a dorsal and a ventral lobe. Metatibia robust, ratio length/width ca. 1/3.0 ..... 35  
23 Left paramere simple ..... 24  
– Left paramere split into two long and narrow filiform lobes ..... 27  
24 Right paramere as long as phallobase. Metatibia slender, ratio length/width ca. 1/3.4. Median lamina of phallobase evenly wide and rounded at apex .... ..... *T. shunbiensis*  
– Right paramere one third as long as phallobase. Metatibia stouter, ratio length/width ca. 1/3.1 ..... 26  
– Right paramere half as long as phallobase ..... 25  
25 Left paramere before apex with a blunt lateral tooth. Right paramere slightly shorter than medial phallobasal lamina ..... *T. champassakana* sp. n.  
– Left paramere before apex without blunt lateral tooth. Right paramere as long as medial phallobasal lamina ..... *T. doipuiensis* sp. n.  
26 Left paramere nearly straight. Median lamina of phallobase narrowed distally, curved dorsally and with a dorsal tooth at apex ..... *T. nabaeoensis* sp. n.  
– Left paramere strongly and evenly curved ventrally. Median lamina of phallobase narrowed distally, curved dorsally and with a dorsal tooth at apex ..... *T. pahinngamensis* sp. n.  
27 Dorsal lobe of left paramere shorter than ventral lobe ..... 28  
– Dorsal lobe of left paramere distinctly longer than the ventral one. Apex of median phallobasal lamina moderately pointed ..... 32  
28 Dorsal lobe of left paramere slightly less than half as long as ventral lobe ..... 29  
– Dorsal lobe of left paramere slightly more than half as long as ventral lobe ... ..... *T. wapiensis*  
29 Right paramere distinctly shorter than median lamina of phallobase ..... 30  
– Right paramere approx. as long as median lamina of phallobase ..... 31  
30 Apex of median phallobasal lamina blunt and curved abruptly dorsally. Right paramere bent only once ..... *T. kiriomensis* sp. n.  
– Apex of median phallobasal lamina sharply pointed. Right paramere bent twice ..... *T. banhuaipoensis* sp. n.  
31 Right paramere bent twice, slightly narrower in lateral view. Apex of median phallobasal lamina sharply pointed ..... *T. matsumotoi*  
– Right paramere bent only once, slightly wider in lateral view. Apex of median phallobasal lamina strongly rounded ..... *T. subrotundata* sp. n.

- 32 Dorsal lobe of left paramere a quarter of its length longer than the ventral one. Right paramere narrower (in lateral view) and half as long as median lamina of phallobase ..... 33
- Dorsal lobe of left paramere twice as long as the ventral one ..... 34
- 33 Dorsal lobe of left paramere only little wider than the ventral one, nearly straight in dorsal view. Right paramere bent in an obtuse angle at middle..... *T. loeiensis* sp. n.
- Dorsal lobe of left paramere distinctly wider than the ventral one, slightly curved (dorsal view). Right paramere bent in a nearly sharp angle at middle .... ..... *T. spanglerorum* sp. n.
- 34 Dorsal lobe of left paramere distinctly exceeding the median lamina of phallobase. Right paramere wider (in lateral view) and little shorter than median lamina of phallobase ..... *T. pailinensis* sp. n.
- Dorsal lobe of left paramere distinctly shorter than the median lamina of phallobase. Right paramere narrower (in lateral view) and distinctly shorter than median lamina of phallobase ..... *T. auriculata* sp. n.
- 35 Left paramere split into two long and narrow filiform lobes. Ventral lobe of right paramere longer, dorsal lobe weakly curved ..... *T. doisangensis*
- Left paramere simple. Ventral lobe of right paramere short, dorsal lobe strongly curved ..... 36
- 36 Left paramere moderately long and wide, not exceeding the median ventral lamina of phallobase; convex at apex ..... *T. sigulianshanica*
- Left paramere long and filiform, widely exceeding the median ventral lamina of phallobase; bluntly widened at apex ..... *T. curviforceps* sp. n.
- 37 Eyes of medium size, ratio diameter/interocular distance  $\geq 0.59$  ..... 61
- Eyes small, ratio diameter/interocular distance  $\leq 0.56$  ..... 38
- 38 Dorsal surface of body unicoloured ..... 39
- Body blackish brown, pronotum reddish ..... *T. rubrithorax* sp. n.
- 39 Left paramere simple ..... 44
- Left paramere divided into two lobes at base ..... 40
- 40 Medial phallobasal lamina at least 1/4 of phallobasal length ..... 41
- Medial phallobasal lamina at maximum 1/10 of phallobasal length ..... *T. thainguyensis* sp. n.
- 41 Left paramere distinctly shorter than the median ventral lamina of phallobase ..... *T. khaosoidaoensis* sp. n.
- Left paramere (dorsal lobe) at least as long as the median ventral lamina of phallobase ..... 42
- 42 Dorsal lobe of left paramere as long as the median ventral lamina of phallobase ..... 43
- Dorsal lobe of left paramere twice as long as the median ventral lamina of phallobase ..... *T. rihai* sp. n.

- 43 Dorsal lobe of left paramere massive and robust. Median phallobasal lamina shortly curved dorsally ..... *T. nonglomensis* sp. n.
- Dorsal lobe of left paramere filiform. Median phallobasal lamina straight and rounded at apex ..... *T. nussi* sp. n.
- 44 Phallobase in dorsal view only slightly asymmetric. Left and right parameres simple, without two lobes ..... 45
- Phallobase in dorsal view strongly asymmetric ..... 47
- 45 Left paramere nearly twice as long as narrow median phallobasal lamina .. 46
- Left paramere little longer than large median phallobasal lamina ..... *T. laotica*
- 46 Left paramere distinctly longer than phallobase. Right paramere strongly curved ventrally at apex ..... *T. saturata*
- Left paramere slightly shorter than phallobase. Right paramere nearly straight (lateral view) ..... *T. filiforceps* sp. n.
- 47 Median lamina of phallobase very short, only one quarter of phallobase length ..... 50
- Median lamina of phallobase approx. half of phallobase length ..... 48
- 48 Robust spines on ventral margin of metatibia subequal in length. Phallobase only little produced at right side ..... *T. cattienensis* sp. n.
- Robust spine at middle of ventral margin of metatibia extremely prolonged and s-shaped, exceeding distal margin of metatibia. Phallobase strongly produced at right side ..... 49
- 49 Median phallobasal lamina wide and blunt at apex, with a dorsal blunt tooth. Left paramere subequal in length with median phallobasal lamina ..... *T. bansanpakiana* sp. n.
- Median phallobasal lamina narrow and sharply pointed at apex, without dorsal tooth. Left paramere distinctly shorter than median phallobasal lamina ..... *T. margheritae* sp. n.
- 50 Both parameres long and filiform, curved ventrally at apex ..... *T. microspinosa* sp. n.
- Left paramere long and filiform, weakly curved; right paramere short and slim, strongly bent at middle ..... *T. microfurcata* sp. n.
- Parameres of other shape ..... 51
- 51 Left paramere short and stout ..... 52
- Left paramere long and narrow, more or less straight ..... 54
- 52 Dorsal lobe of right paramere after basal third strongly curved (dorsal view). Body evenly reddish to dark brown, dorsally only slightly darker ..... 53
- Right paramere without dorsal lobe but simple ..... *T. doiphukhaensis* sp. n.
- 53 Dorsal lobe of right paramere at apex simply pointed (dorsal view) ..... *T. falciformis* sp. n.
- Dorsal lobe of right paramere at apex with a sharp hook (dorsal view) ..... *T. pseudoliangheensis* sp. n.

- 54 Right paramere more or less straight (ventral view). Dorsal surface blackish, ventral surface reddish brown..... 55
- Right paramere strongly u-shaped curved. Body evenly reddish to dark brown..... *T. senohi*
- 55 Right paramere at base not split into two lobes, without spines ..... 56
- Right paramere at base split into two short but widely separated lobes, without spines ..... 58
- Right paramere at base with divergent spines and a distal separated lobe..... *T. phatoensis* sp. n.
- 56 Right paramere simply pointed. Left paramere narrow, with blunt ventral lobe..... 57
- Right paramere hammer-shaped, with a sharply pointed apical double spine, one directed dorsally, and a larger one ventrally. Left paramere wider, with fine dorsal basal lobe ..... *T. romae* sp. n.
- 57 Apical lobe of left paramere narrow. Right paramere inserted only little more basally than the left paramere..... *T. longzhouensis*
- Apical lobe of left paramere wider. Right paramere inserted much more basally than the left paramere ..... *T. olegi* sp. n.
- 58 Ventral metatibial spine normal, distinctly shorter than first metatarsomere. Left paramere moderately long and moderately narrow. Apex of dorsal lobe of right paramere without short setae..... 59
- Ventral metatibial spine extremely elongated, distinctly exceeding first metatarsomere. Left paramere long and narrow, without dorsal subbasal lobe. Apex of dorsal lobe of right paramere with dense short setae..... *T. bachmaensis* sp. n.
- 59 Left paramere with a short dorsal subbasal lobe. Dorsal lobe of right paramere short ..... *T. cucphongensis* sp. n.
- Left paramere without dorsal subbasal lobe..... 60
- 60 Dorsal lobe of right paramere long..... *T. falciforceps* sp. n.
- Dorsal lobe of right paramere short..... *T. geiserae* sp. n.
- 61 Both parameres with dorsal and ventral lobe..... 62
- One or both parameres simple, without two lobes ..... 66
- 62 Dorsal lobe of right paramere simple, not composed of fine spines ..... 63
- Dorsal lobe of right paramere composed of fine spines..... 65
- 63 Dorsal lobe of right paramere directed distally ..... 64
- Dorsal lobe of right paramere directed basally..... *T. ululalatensis* sp. n.
- 64 Dorsal lobe of left paramere as long as ventral one ..... *T. fikaceki*
- Dorsal lobe of left paramere much shorter than ventral one ..... *T. univestris*
- Dorsal lobe of left paramere much longer than ventral one ..... *T. miniatula*
- 65 Dorsal lobe of right paramere shorter, less than 1/3 as long as phallobase..... *T. chiangdaoensis*
- Dorsal lobe of right paramere longer, half as long as phallobase..... *T. kollae* sp. n.

66	Both parameres simple, without two lobes.....	67
—	One of parameres complex, with two lobes.....	72
67	Right paramere distinctly wider (dorsal view) than the left one .....	68
—	Right paramere as wide as (dorsal view) the left one.....	69
68	Dorsolateral tooth at basal quarter of right paramere, right paramere narrower (lateral view) .....	<i>T. damadiensis</i>
—	Dorsolateral tooth at basal third of right paramere, right paramere wider (lateral view) .....	<i>T. semidamadiensis</i> sp. n.
69	Left paramere one third as long as phallobase. Median lamina of phallophase not widened at apex.....	<i>T. xiengkhouangensis</i> sp. n.
—	Left paramere longer.....	70
70	Left paramere as long as phallobase.....	71
—	Left paramere half as long as phallobase .....	<i>T. petrpacholakoi</i> sp. n.
71	Median lamina of phallophase strongly widened and truncate at apex .....	<i>T. constanti</i> sp. n.
—	Median lamina of phallophase not widened at apex .	<i>T. vientianeensis</i> sp. n.
72	Right paramere simple, left one with two lobes.....	73
—	Left paramere simple, right one with two lobes.....	78
73	Right paramere basiventrally strongly widened towards apex, at base with a narrow long basal lobe .....	<i>T. yaoquensis</i>
—	Right paramere evenly narrowed towards apex .....	74
74	Dorsal surface dark brown .....	76
—	Dorsal surface yellowish brown .....	75
75	Ventral lobe of left paramere wider, stronger curved ventrally. Dorsal lobe of left paramere bluntly widened before apex .....	<i>T. shanensis</i> sp. n.
—	Ventral lobe of left paramere narrower, nearly straight (lateral view). Dorsal lobe of left paramere nearly evenly narrowed towards apex .....	<i>T. semishanensis</i> sp. n.
76	Left paramere with a dorsal lobe distant from base.....	77
—	Left paramere with dorsal lobe at base, lobe robust (nearly half as long as paramere) and at apex convex .....	<i>T. breviforceps</i> sp. n.
77	Left paramere narrower, with a short fine dorsal lobe before the middle.....	<i>T. trilobiforceps</i> sp. n.
—	Left paramere shorter and stouter, with a short fine dorsal lobe behind the middle .....	<i>T. phukradungensis</i> sp. n.
78	Left paramere long, slender .....	79
—	Left paramere shorter, stouter, almost straight.....	<i>T. wangtongensis</i>
79	Left paramere bent externally. Distal lobe of right paramere short.....	80
—	Left paramere bent straight, split shortly before apex. Distal lobe of right paramere long, more than half as long as phallobase .....	<i>T. jakli</i> sp. n.
80	Basal lobe of right paramere short, without spines. Insertion of right parameres lateral.....	<i>T. changjiangensis</i>
—	Basal lobe of right paramere moderately long, with trichome-like spines. Insertion of right parameres displaced dorsally .....	81

81	Left paramere half as long as phallobase .....	<i>T. setuliforceps</i> sp. n.
-	Left paramere as long as phallobase.....	<i>T. parasetuliforceps</i> sp. n.
82	Right paramere basally with brush of robust trichome-like spines .....	83
-	Right paramere without brush of spines.....	102
83	Left paramere composed of two lobes .....	84
-	Left paramere simple.....	88
84	Left paramere long, as long as the ventral distal phallobasal process .....	85
-	Left paramere short and trifid, 1/3 as long as the ventral distal phallobasal process.....	87
85	Ventral lobe of right paramere abruptly and strongly widened at apex, dorsal lobe of right paramere obsolete but with dense trichomes .....	86
-	Ventral lobe of right paramere not widened at apex, dorsal lobe of right paramere moderately long and narrow, composed of fine spines .....	
	.....	<i>T. pluriuncinata</i> sp. n.
86	Ventroapical lobe of right paramere narrower, ventral lobe of left paramere little shorter than the dorsal one .....	<i>T. allochangshouensis</i> sp. n.
-	Ventroapical lobe of right paramere wider, ventral lobe of left paramere one third as long as the dorsal one .....	<i>T. changshouensis</i>
87	Median lamina of phallobase with a small dorsal preapical tooth. Dorsal lobe of left parameres and median lamina of phallobase distinctly longer than phallobase.....	<i>T. siantarensis</i> (Sumatra)
-	Median lamina of phallobase without dorsal preapical tooth. Dorsal lobe of left parameres and median lamina of phallobase as long as phallobase.....	
	.....	<i>T. feresiantarensis</i> sp. n.
88	Left paramere with small lateral basal tooth .....	<i>T. linaoshanica</i>
-	Left paramere without small lateral basal tooth .....	89
89	Left paramere split in two filiform branches behind anterior third .....	90
-	Left paramere simple.....	94
90	Median phallobasal lamina convex or simply pointed at apex .....	91
-	Median phallobasal lamina bifurcate at apex .....	<i>T. quadrifurcata</i> sp. n.
91	Filiform branches of left paramere long, at least approx. one third of paramere length .....	92
-	Filiform branches of left paramere very short, much less than one length of paramere length .....	93
92	Filiform branches of left paramere approx. one third of paramere length. Median phallobasal lamina most of its distal part narrow .....	<i>T. menegeana</i>
-	Filiform branches of left paramere approx. two third of paramere length. Median phallobasal lamina evenly narrowed towards apex .....	<i>T. allomenegeana</i> sp. n.
93	Distal lobe of right paramere long and robust, strongly curved upward (lateral view), with a strong subapical ventral tooth .....	<i>T. finociliata</i> sp. n.
-	Distal lobe of right paramere short, weakly curved (lateral view), without ventral tooth .....	<i>T. appendiculata</i> sp. n.
94	Left paramere distinctly longer than phallobase .....	95
-	Left paramere as long as phallobase, evenly curved.....	<i>T. sapana</i> sp. n.

95	Left paramere bent twice or entirely curved .....	100
—	Left paramere in basal half straight.....	96
96	Left paramere before apex with tiny tooth or tooth-like process .....	97
—	Left paramere before apex without tiny tooth ..... <i>T. konchurangensis</i> sp. n.	
97	Median lamina of phallobase straight and strongly narrowed after basal the third .....	98
—	Median lamina of phallobase distinctly curved and evenly narrowed from base to apex .....	<i>T. namnnaoensis</i> sp. n.
98	Median lamina of phallobase distinctly shorter than left paramere, simply pointed, slightly rounded at apex .....	99
—	Median lamina of phallobase approx. as long as left paramere, slightly bifurcate at apex. Preapical tooth of left paramere dorsally and duplicate.....	<i>T. smetsi</i> sp. n.
99	Preapical tooth of left paramere laterally. Left paramere strongly curved.....	<i>T. shangsiensis</i>
—	Preapical tooth of left paramere dorsally, transformed into a filiform process that is rounded at apex. Left paramere nearly straight .....	<i>T. gressitti</i>
100	Dorsal lobe of right paramere very small .....	101
—	Dorsal lobe of right paramere large, nearly as long as ventral lobe .....	<i>T. tonkinensis</i>
101	Left paramere bent twice. Median lamina of phallobase in apical half distinctly narrowed.....	<i>T. xichouensis</i>
—	Left paramere nearly uniformly curved. Median lamina of phallobase in apical half not narrowed .....	<i>T. paratonkinensis</i> sp. n.
102	Right paramere simple, not composed of two lobes .....	103
—	Right paramere composed of two lobes.....	121
103	Left paramere at base simple .....	109
—	Left paramere at base composed of two lobes.....	104
104	Right paramere at least subequal in length to phallobase, without apical hook ventrally.....	105
—	Right paramere approx. one third as long as phallobase, or shorter .....	107
—	Right paramere half as long as phallobase. Left paramere longer than phallobase.....	<i>T. koi</i> sp. n.
105	Ventral distal spine of metatibia inserted at apex of metatibia and much shorter than the metatarsomere 1. Basal lobe of left paramere $\frac{1}{4}$ as long as ventral lobe .....	<i>T. longipenis</i>
—	Ventral distal spine of metatibia inserted shortly behind middle of ventral margin of metatibia and longer than the long metatarsomere 1.....	106
106	Basal lobe of left paramere half as long as ventral lobe.....	<i>T. angkhangensis</i>
—	Basal lobe of left paramere as long as ventral lobe.....	<i>T. giulianae</i> sp. n.
107	Phallobase at right side not strongly produced. Right paramere with a small apical hook ventrally .....	<i>T. tanahbrataensis</i> sp. n.
—	Phallobase at right side strongly produced.....	108

- 108 Right paramere without small apical hook. Dorsal lobe of left paramere small ..... *T. maerimensis*
- Right paramere with a small apical hook. Dorsal lobe of left paramere half as long as ventral lobe ..... *T. angkorthomensis* sp. n.
- 109 Left paramere over its entire length not split, but simple ..... 112
- Left paramere split behind base into two long filiform branches ..... 110
- 110 Left paramere split behind basal third. Right paramere short and curved .....  
..... *T. dongnaiensis* sp. n.
- Left paramere split in apical half. Right paramere long and straight ..... 111
- 111 Right paramere split into two narrow branches at apical quarter ..... *T. sejugata*
- Right paramere split into two narrow branches at basal third .....  
..... *T. allosejugata* sp. n.
- 112 Left paramere more or less narrow, at middle distinctly narrower than apex of phallobase (lateral view) ..... 113
- Left paramere wide over its entire length, at middle nearly as wide as apex of phallobase (lateral view) ..... *T. fulleri* sp. n.
- 113 Left paramere strongly bent at base ..... 117
- Left paramere straight at base ..... 114
- 114 Left paramere straight in basal half distinctly wider than in apical half. Right paramere half as long as phallobase ..... *T. desalvazzai* sp. n.
- Left paramere straight in basal half only little wider than in apical half. Right paramere at maximum one third as long as phallobase ..... 115
- 115 Median lamina of phallobase at apex curved dorsally. Basis of left paramere not extended ventrally ..... *T. angkorwatensis* sp. n.
- Median lamina of phallobase at apex straight. Basis of left paramere strongly extended ventrally ..... 116
- 116 Right paramere much less than one third as long as left paramere .....  
..... *T. pseudoruiliensis* sp. n.
- Right paramere one third as long as left paramere ..... *T. gestroi*
- 117 Left paramere bent downward basally. Median phallobasal lamina simply pointed ..... 118
- Left paramere bent upward basally. Median phallobasal lamina widened and sharply truncate at apex ..... *T. vari* sp. n.
- 118 Median lamina of phallobase straight. Phallobase at right side not strongly produced ..... 119
- Median lamina of phallobase evenly curved ventrally. Phallobase at right side strongly produced ..... *T. infida* sp. n.
- 119 Ventral terminal spine of metatibia slightly shorter than first metatarsomere ..... 120
- Ventral terminal spine of metatibia distinctly longer than first metatarsomere. Right paramere strongly bent at middle (lateral view) .... *T. spinotibialis* sp. n.
- 120 Right paramere moderately bent at middle (lateral view) ..... *T. ruiliensis*
- Right paramere nearly straight (lateral view) ..... *T. semiruiliensis* sp. n.

121	Left paramere simple.....	123
—	Left paramere composed of two lobes .....	122
122	Right side of phallobase strongly produced. Dorsal lobe of left paramere as long as ventral one .....	<i>T. soppongana</i> sp. n.
—	Right side of phallobase not strongly produced. Dorsal lobe of left paramere short, distinctly shorter than ventral one.....	129
123	Dorsal lobe of right paramere wide, with sickle-shaped, large apical hook.....	<i>T. tianchiensis</i>
—	Dorsal lobe of right paramere narrow, evenly curved or straight, and sharply pointed.....	124
124	Left paramere filiform. Right paramere much less than half as long as left paramere.....	<i>T. jinghongensis</i>
—	Left paramere elongate and robust .....	125
125	Left paramere with a large triangular dorsomedian extension .....	126
—	Left paramere without large dorsomedian extension .....	127
126	Right paramere slightly more than half as long as left paramere. Split between lobes of right parameres deep, dorsal lobe as long as ventral lobe.....	<i>T. veliformis</i> sp. n.
—	Right paramere half as long as left paramere. Dorsal lobe of right paramere distinctly shorter than ventral lobe.....	<i>T. umphangensis</i> sp. n.
127	Right paramere a quarter as long as left paramere. Split between lobes of right parameres little deep, dorsal lobe reduced in size.....	<i>T. latefemorata</i>
—	Right paramere half as long as left paramere. Split between lobes of right parameres deep, dorsal lobe not reduced in size.....	128
128	Left paramere at middle narrow (lateral view), only little longer than median phallobasal lamina .....	<i>T. bolavensis</i> sp. n.
—	Left paramere at middle distinctly widened, distinctly longer than median phallobasal lamina .....	<i>T. nakaiensis</i> sp. n.
129	Dorsal lobe of right paramere triangular and short, sharply pointed.....	<i>T. menglongensis</i>
—	Dorsal lobe of right paramere convexly widened and elongate ....	<i>T. ruiliiana</i>

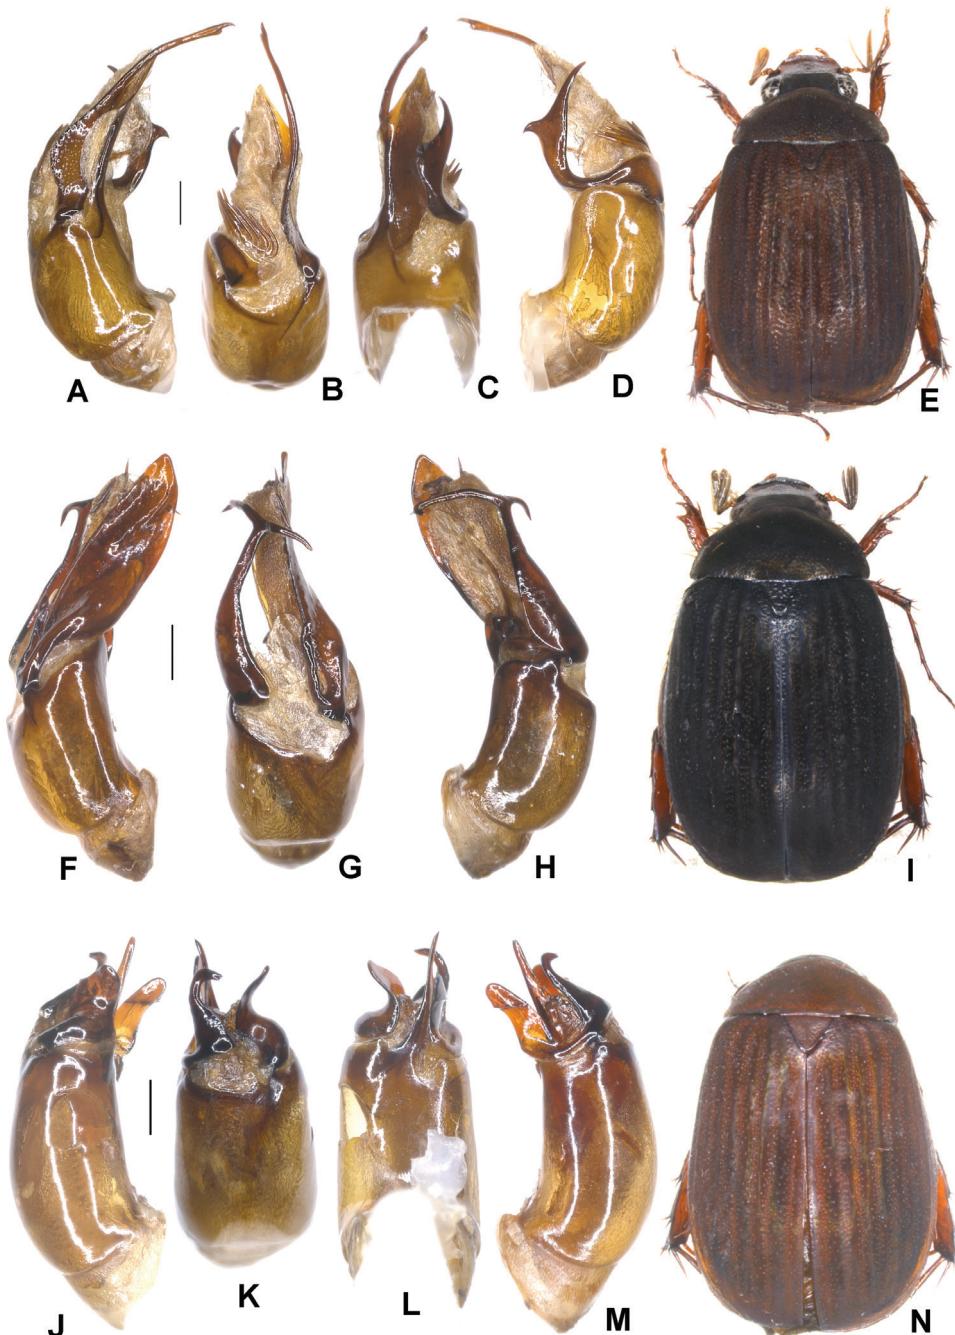

## Descriptions

### *Tetraserica finociliata* sp. n.

<http://zoobank.org/FD9F606D-0301-4790-B3A6-43FA7E59E440>

Figures 1, 47

**Type material examined.** Holotype: ♂ “Myanmar (Burma) 21 km E Putao, H-550 m Nan S Bon vill., 1-5.5.98 leg S. Murzin & V. Sinaev/ Coll. D. Ahrens/ 215 Sericini Asia spec.” (ZFMK). Paratypes: 1 ♂ “Myanmar (Burma) 25 km E Putao, H-800 m Nan Sa Bon vill., 6-9.5.98 leg S. Murzin & V. Sinaev/ Coll. D. Ahrens” (ZFMK), 1 ♂

**Figure I.** **A–E** *Tetraserica finociliata* sp. n. (holotype) **F–I** *T. romae* sp. n. (holotype) **J–N** *T. neouncinata* sp. n. (holotype) **A, F, J** aedeagus, left side lateral view **D, H, M** aedeagus, right side lateral view **B, G, K** parameris, dorsal view **C, L** parameres, ventral view **E, I, N** habitus. Scale bars: 0.5 mm. Habitus not to scale.

“Myanmar (Burma) 21 km S Putao, H-550 m Nan Sa Bon vill., 1-5.5.98 leg S. Murzin & V. Sinaev/ Coll. D. Ahrens” (ZFMK).

**Description.** Length of body: 8.9 mm; length of elytra: 6.8 mm; maximum width: 5.4 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.67. Ratio of length of metepisternum/metacoxa: 1/1.53. Metatibia moderately long and wide, ratio width/length: 1/3.77; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 1A–D. Habitus: Fig. 1E.

Female unknown.

**Variation.** Length of body: 8.9–10.2 mm; length of elytra: 6.8–7.1 mm; maximum width: 5.4–5.8 mm.

**Diagnosis.** *Tetraserica finociliata* sp. n. differs from all other *Tetraserica* species by the long and robust distal lobe of right paramere being strongly curved upwards (lateral view), and having a strong subapical ventral tooth.

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Latin words *fino-* (fine) and *ciliatus* (ciliate), with reference to the fine comp of trichomes at the base of the right paramere.

#### *Tetraserica romae* sp. n.

<http://zoobank.org/39DC2D2E-F504-4252-8659-2DCF8231C784>

Figures 1, 51

**Type material examined.** Holotype: ♂ “Vietnam-N (Na Hang) 160 km NW Ha Noi, NE env. of Na Hang 26.5–6.6.1996 150–200 m lg. A. Napolov & I. Roma/CNa Riga” (ZFMK). Paratype: 1 ♂ “X-DA4501 labcode: VD 023 Vietnam: Tuyn Quang pr. SE-E env. of Na Hang, 200–700 m 22°17'30”–22°30”N, 105°26’–28°E, 1-12.v.2010 L. Dembicky leg. (VN2/2010 MZM EXPEDITION) *Tetraserica* sp VI\_V1” (ZFMK), 2 ♂♂ “Vietnam-N Tuyen quang pr. SE-E env. of Na Hang 22°17'30”–22°30”N, 105°26’–28°E, 200–700 m L. Dembicky leg., 1.-12.V.2010” (ZFMK).

**Description.** Length of body: 7.3 mm; length of elytra: 5.3 mm; maximum width: 4.6 mm. Dorsal surface blackish, ventral surface reddish brown. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.46. Ratio of length of metepisternum/metacoxa: 1/1.65. Metatibia moderately long and wide, ratio width/length: 1/3.81; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 1F–H. Habitus: Fig. 1I.

Female unknown.

**Variation.** Length of body: 7.3–8.1 mm; length of elytra: 5.3–5.8 mm; maximum width: 4.6–5.0 mm.

**Diagnosis.** *Tetraserica romae* sp. n. differs from all other *Tetraserica* species by the right hammer-shaped paramere, which has a sharply pointed double spine at apex, one directed dorsally, and a larger one ventrally.

**Etymology.** The new species is named after one of its collectors, Ilona Roma (noun in genitive singular).

***Tetraserica neouncinata* sp. n.**

**Type material examined.** Holotype: ♂ “NE-Laos: Houa Phan prov.; Ban Saleui, Phou Pan (Mt.)- 20°12'N, 104°01'E, 11.iv.-15.v. 2012, 1300–1900 m leg. C. Holzschuh - ZFMK Ankauf 2012” (ZFMK). Paratypes: 1 ♂ “X-DA4582/ X-DA4582 labcode VD049 Laos: Houa Phan prov.; Ban Saleui, Phou Pan (Mt.)- 20°12'N, 104°01'E, 15-30.iv.2014 leg. C. Holzschuh Ankauf 2014/ Tetraserica spLA\_V22/ sp-LA-V22” (ZFMK), 1 ♂ “Laos-NE, Houa Phan prov., 20°12–13.5'N, 103°59.5'-104°01'E, Ban Saluei- Phou Pane Mt., 1340–1870 m, 10.v.-16.vi.2009, M. Brancucci & local coll. leg./ NHMB Basel, NMPC Prague Laos 2009 Expedition: M. Brancucci, M. Geiser, Z. Kraus, D. Hauck, V. Kubán” (NHMB), 2 ♂♂ “NE-Laos: Houa Phan prov., 20°13'09–19"N, 103°59'54"-104°00'03"E, 1480–1510 m, Phou Pane Mt., 22.iv.-14.v.2008, Vít Kubán leg.” (ZFMK), 1 ♂ “Myanmar, Mandalay prov. Kyaukpadanng 10.6.2009 From Li Jingke” (ZFMK).

**Description.** Length of body: 8.8 mm; length of elytra: 7.9 mm; maximum width: 6.1 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.55. Ratio of length of metepisternum/metacoxa: 1/1.76. Posterior margin of metafemur with blunt tooth. Metatibia moderately long and wide, ratio width/length: 1/3.31; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 1J–M. Habitus: 1N.

Female unknown.

**Variation.** Length of body: 8.8–9.8 mm; length of elytra: 7.1–7.9 mm; maximum width: 5.8–6.1 mm.

**Diagnosis.** The new species differs from the similar *T. daqingshanica* by the dorsal lobe of the right paramere being wide and straight in the basal half and curved in the apical half; the apex of left paramere gently narrows towards apex in *T. neouncinata*.

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Greek word *neo-* (new) and Latin word *uncinatus*, with reference to the uncinate shape of the right paramere.

***Tetraserica pseudouncinata* sp. n.**

<http://zoobank.org/83311389-FED9-4ECF-BAB2-A07C820F9644>

Figures 2, 50

**Type material examined.** Holotype: ♂ “X-DA4693 labcode: VD086 China, Guangxi A.R., Schiwandashan National Forest Park (forested river valley; at light), 290–360 m,

21°54.4'N, 107°54.2'E, 5-9.iv.2013, M. Fikáček, J. Hájek, J. Růžička leg. *Tetraserica* spCH\_V47/ sp-CH-V47/ X-DA4693" (ZFMK).

**Description.** Length of body: 9.3 mm; length of elytra: 6.9 mm; maximum width: 5.9 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.58. Ratio of length of metepisternum/metacoxa: 1/1.7. Posterior margin of metafemur with blunt tooth. Metatibia moderately long and wide, ratio width/length: 1/3.31; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 2A–D. Habitus: Fig. 2E.

Female unknown.

**Diagnosis.** *Tetraserica pseudouncinata* sp. n. differs from *T. neouncinata* by the left paramere being two thirds as wide as length of the antennal club (rather than one quarter as wide as in *T. neouncinata*).

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Greek word *pseudo-* (false) and Latin word *uncinatus*, with reference to the uncinated shape of the right paramere.

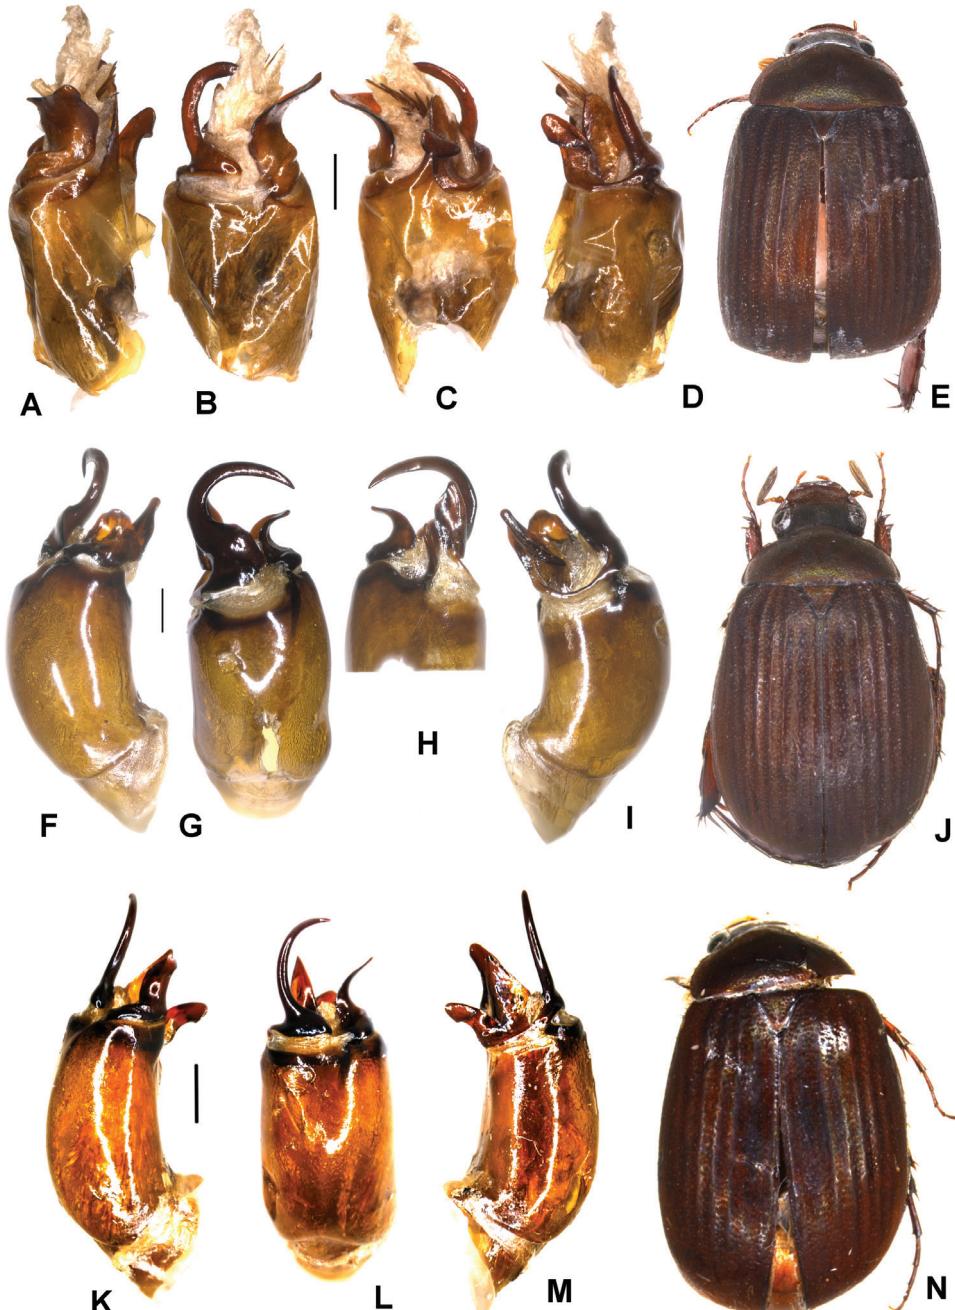

### *Tetraserica falciformis* sp. n.

<http://zoobank.org/4BC31299-C3A5-4981-8735-E4D6A2757300>

Figures 2, 48

**Type material examined.** Holotype: ♂ "Laos, Champassak Prov. Dong Hua Xao NBCA 2 km S of Ban NongLuang, bank of Touay-Guai stream/ 15°4'N, 106°13'E, 800 m, at light, No. 24 1-5.IV.1998, leg. O. Merkl & G. Csorba/ 599 Sericini Asia spec." (HNHM). Paratypes: 2 ♂♂ "Laos, Champassak Prov. Dong Hua Xao NBCA 2 km S of Ban NongLuang, bank of Touay-Guai stream/ 15°4'N, 106°13'E, 800 m, at light, No. 24 1-5.IV.1998, leg. O. Merkl & G. Csorba" (HNHM, ZFMK), 3 ♂♂ "Laos, Attapeau prov.; Annam Highlands Mts Dong Amphan; NBCA, ca. 1160 m NONG FA (crater lake) env.; 15°05.9'N, 107°25.6'E, St. Jakl lgt, 30.4.-6.5.2010" (NMPC, ZFMK), 1 ♂ "X-DA4499 labcode: VD022 Laos, Attapeu prov. Annam Highlands Mts. Dong Amphan NBCA, ca.1160 m NONG FA (crater lake) env. 15°05.9'N, 107°25.6'E, 30.iv-6.v.2010, Jiří Hájek leg. *Tetraserica* spLA\_Annam1/ X-DA4499/ sp-LA-Annam1" (ZFMK), 1 ♂ "X-DA4498 labcode: VD021 Laos, Attapeu prov. Annam Highlands Mts. Dong Amphan NBCA, ca.1160 m NONG FA (crater lake) env. 15°05.9'N, 107°25.6'E, 30.iv-6.v.2010, Jiří Hájek leg. *Tetraserica* spLA\_Annam1/ X-DA4498" (ZFMK).

**Description.** Length of body: 11.8 mm; length of elytra: 7.5 mm; maximum width: 7 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.53. Ratio of length of metepisternum/metacoxa: 1/1.58. Metatibia short and wide, ratio width/length: 1/3.21; basal group of dorsal spines of metatibia at first third of metatibial length.

**Figure 2.** **A–E** *Tetraserica pseudouncinata* sp. n. (holotype) **F–J** *T. falciformis* sp. n. (holotype) **K–N** *T. sculptilis* Liu et al., 2014 (holotype). **A, F, K** aedeagus, left side lateral view **D, I, M** aedeagus, right side lateral view **B, G, L** parameres, dorsal view **C, H** parameres, ventral view **E, J, N** habitus. Scale bars: 0.5 mm. Habitus not to scale.

Aedeagus: Fig. 2F–I. Habitus: Fig. 2J.

Female unknown.

**Variation.** Length of body: 11.8–12.5 mm; length of elytra: 7.5–9.2 mm; maximum width: 6.4–7.0 mm.

**Diagnosis.** *Tetraserica falciformis* sp. n. differs in male genital shape from the similar *T. sculptilis* by having the posterior margin of metafemur straight rather than being blunt or with a tooth; furthermore, the dorsal lobe of the right paramere is markedly curved and strongly widened at base.

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Latin words *falcis-* (sickle) and *formis* (of shape), with reference to the sickle-shaped right paramere.

#### ***Tetraserica sculptilis* Liu, Fabrizi, Bai, Yang & Ahrens, 2014**

Figures 2, 56

*Tetraserica sculptilis* Liu, Fabrizi, Bai, Yang & Ahrens, 2014: 89, fig. 1E–H.

**Material examined. Vietnam:** 1 ♂ “Vietnam: Vinh Phú: Tam Doa W. Edge of the town. 930 m 20°31 May 1996 B. Hubley R. Bain. ROM 961033/ UV light; scrub growth at 1° forest edge 21°27'N, 105°39'E” (HWML), 1 ♂ “Vietnam, Vinh Phú: Tam Dao Hill Stn. Telecommunications tower, Jan-May 1996 per B. Hubley, ROM 961024” (HWML).

Aedeagus: Fig. 2K–M. Habitus: Fig. 2N.

**Remarks.** The species was known only from China (Hubei and Yunnan provinces); it is now recorded for first time from northern Vietnam.

#### ***Tetraserica pseudoliangheensis* sp. n.**

<http://zoobank.org/3DA098CC-2732-4296-A73A-B4F8F0604C23>

Figures 3, 50

**Type material examined.** Holotype: ♂ “Laos centr. Khammouan prov. NAKAI env. 4-8.5.1998, Route No 8, alt 560±20 m, N17°42.8, E 105°08.9 (GPS) E. Jendek & O. Šausa leg./ Coll. P. Pacholátko/ 167 Sericini Asia spec.” (CPPB).

**Description.** Length of body: 10.1 mm; length of elytra: 7.5 mm; maximum width: 6.3 mm. Surface of labrolypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.57. Ratio of length of metepisternum/metacoxa: 1/1.58. Metatibia short and wide, ratio width/length: 1/2.89; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 3A–C. Habitus: Fig. 3D.

Female unknown.

**Diagnosis.** *Tetraserica pseudoliangheensis* sp. n. differs from *T. falciformis* by the dorsal lobe of right paramere having a sharp hook at its apex (dorsal view). The species is also rather similar to *T. liangheensis* Liu et al., 2014; however, in the new species the posterior margin of metafemur does not possess a tooth and the dorsal lobe of the right paramere is much wider at the base.

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Latin words *pseudo-* (nearly) and the species name *liangheensis*, with reference to the similarity to *T. liangheensis* Liu et al., 2014.

***Tetraserica liangheensis* Liu, Fabrizi, Bai, Yang & Ahrens, 2014**

Figures 3, 48

**Type material examined.** Holotype: ♂ “Thai 24-29-iv.1993 Doi Suthep Pacholátko & Dembický leg./ coll. P. Pacholátko/ 141 Sericini Asia spec.” (CPPB). Paratype: 1 ♂ “Laos, La Oudomxay 16.6.2005, ex coll. Sabatinelli” (ZFMK).

**Description.** Length of body: 10.4 mm; length of elytra: 7.6 mm; maximum width: 6.6 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.56. Ratio of length of metepisternum/metacoxa: 1/1.63. Posterior margin of metafemur with sharp hook. Metatibia moderately long and wide, ratio width/length: 1/4.14; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 3I–K. Habitus: Fig. 3L.

Female unknown.

**Variation.** Length of body: 10.1–10.4 mm; length of elytra: 7.4–7.6 mm; maximum width: 5.5–6.6 mm.

**Diagnosis.** *Tetraserica doisuthepensis* sp. n. differs from *T. liangheensis* Liu et al., 2014 by the dorsal lobe of right paramere being weakly curved, barely exceeding the ventral lobe of right paramere, and in having no additional hook at the apex. The new species differs from *T. sculptilis* by the stouter left paramere having a bluntly angulate dorsal margin.

**Etymology.** The new species is named after the type locality, Doi Suthep (adjective in the nominative singular).

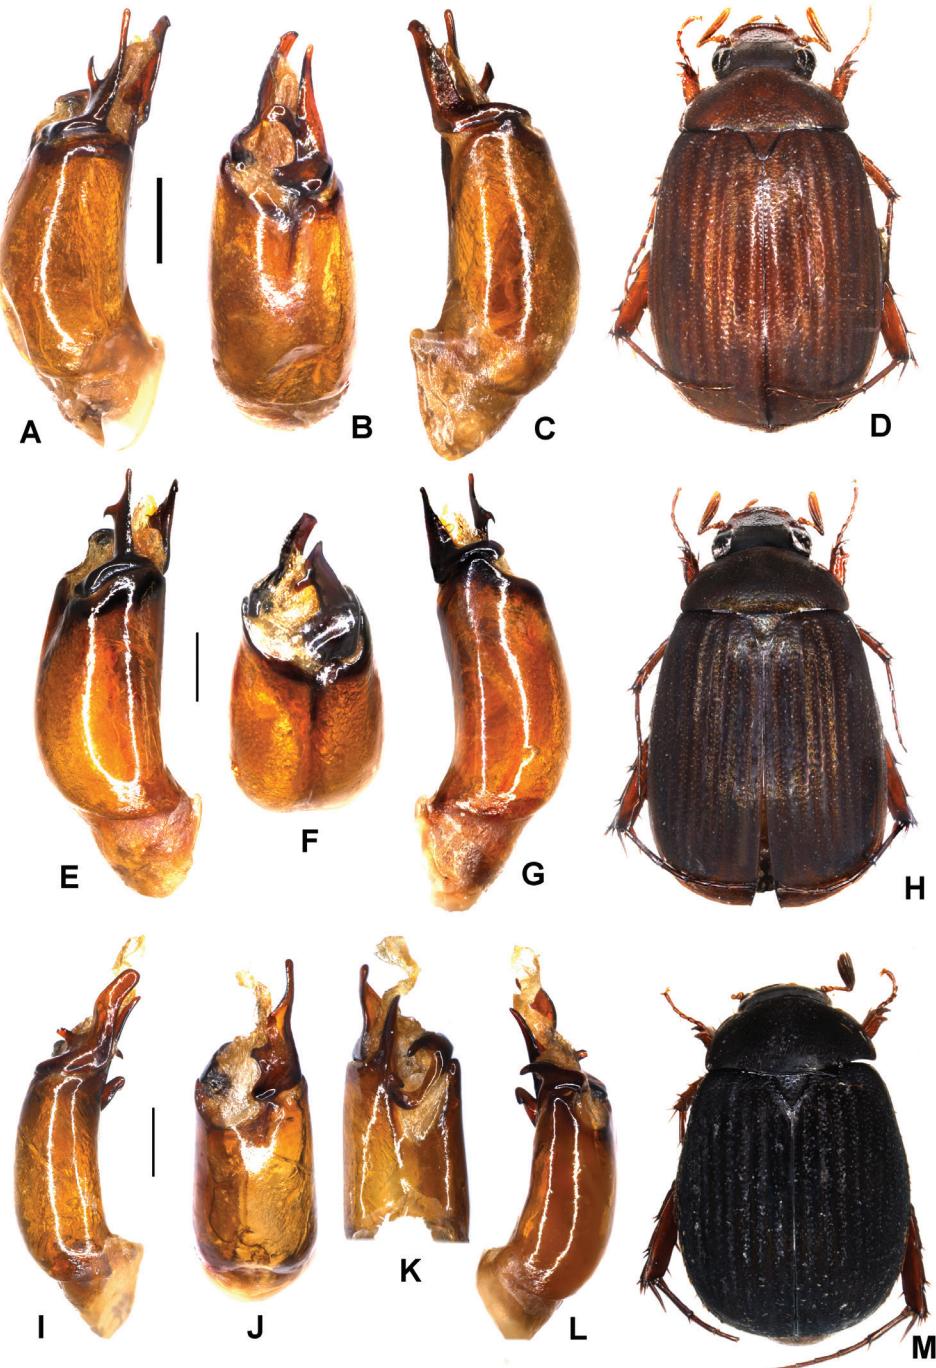

***Tetraserica trilobiforceps* sp. n.**

<http://zoobank.org/8B06FEB0-DBD9-440E-8416-94C1F3588FD2>

Figures 4, 46

**Type material examined.** Holotype: ♂ “N-Vietnam, Cuc Phuong Nat. Park. 21-22.v.1996 Pacholátko & Dembicky leg./ coll. P. Pacholátko/ 937 Sericini Asia spec.” (CPPB).

**Description.** Length of body: 7.3 mm; length of elytra: 5.5 mm; maximum width: 4.9 mm. Dorsal surface blackish, ventral surface reddish brown. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.48. Ratio of length of metepisternum/metacoxa: 1/1.67. Metatibia moderately long and wide, ratio width/length: 1/3.33; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 4I–L. Habitus: Fig. 4M.

Female unknown.

**Diagnosis.** This species differs from all other *Tetraserica* species in having a simple left paramere, by the strongly asymmetric phallobase (dorsal view), the very short median lamina of phallobase, and by having the right paramere more or less straight (ventral view).

**Etymology.** The new species is named after the type locality, Cuc Phuong (adjective in the nominative singular).

***Tetraserica geiserae* sp. n.**

<http://zoobank.org/7429EB1F-D04A-4AC9-9722-9CA7A5A83B5D>

Figures 5, 47

**Type material examined.** Holotype: ♂ “Tonkin occ. Rég. de Hoa Binh R.P.A. de Cooman 1918/ 1006 Asia Sericini spec.” (MNHN). Paratypes: 3 ♂♂ “Tonkin occ. Rég. de Hoa Binh R.P.A. de Cooman 1918” (MNHN, ZFMK).

**Description.** Length of body: 7 mm; length of elytra: 4.9 mm; maximum width: 4.3 mm. Dorsal surface blackish, ventral surface reddish brown. Surface of labroclypeus and disc of frons both glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.46. Ratio of length of metepisternum/metacoxa: 1/1.81. Metatibia short and wide, ratio width/length: 1/3.27; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 5A–C. Habitus: Fig. 5D.

Female unknown.

**Variation.** Length of body: 7.0–7.1 mm; length of elytra: 4.9–6.2 mm; maximum width: 4.3–5.2 mm.

**Diagnosis.** *Tetraserica geiserae* sp. n. differs from *T. cucphongensis* in lacking the dorsal subbasal lobe of the left paramere.

**Etymology.** The new species is named in honour of Dr Geiser, Silvia's oncologist, for all her efforts and care (noun in genitive singular).

***Tetraserica thainguyensis* sp. n.**

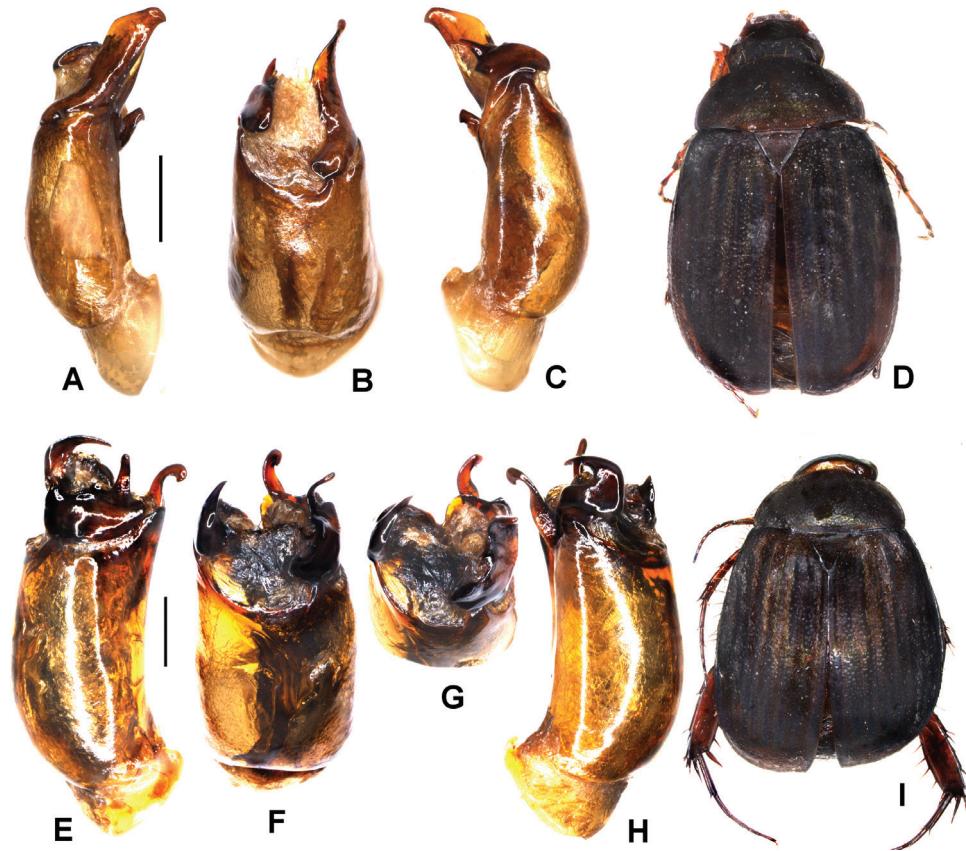

<http://zoobank.org/05FB20E2-38C8-477D-A1EC-163DA2209D30>

Figures 5, 53

**Type material examined.** Holotype: ♂ “N. Vietnam: 40 km NE Thainguyen, 300 m, 8.V.1963, leg. O. Kabakov/ 1009 Asia Sericini spec.” (ZIN).

**Description.** Length of body: 7.6 mm; length of elytra: 7.1 mm; maximum width: 6.3 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.56. Ratio of length of metepisternum/metacoxa: 1/1.74. Metatibia short and wide, ratio width/length: 1/2.32; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 5E–H. Habitus: Fig. 5I.

**Figure 5.** **A–D** *Tetraserica geiserae* sp. n. (holotype) **E–I** *T. thainguyensis* sp. n. (holotype) **A, E** aedeagus, left side lateral view **C, H** aedeagus, right side lateral view **B, F** parameres, dorsal view **G** parameres distal view **D, I** habitus. Scale bars: 0.5 mm. Habitus not to scale.

Female unknown.

**Diagnosis.** *Tetraserica thainguyensis* sp. n. differs from the similar *T. geiserae* by having the left paramere very short and split into two lobes.

**Etymology.** The new species is named with reference to its occurrence close to Thainguyen (adjective in the nominative singular).

#### *Tetraserica xiengkhouangensis* sp. n.

<http://zoobank.org/CF5C626E-3D40-4FEA-8B3D-98CBD006C399>

Figures 6, 51

**Type material examined.** Holotype: ♂ “LAOS-NE, Xieng Khouang prov., 19°37' 8''N, 103°20'E, 30km NE Phonsavan Ban Na Lam- > Phou Sane Mt., 1300–1500 m, 10.-30.v.2009, M. Brancucci leg./ NHMB Basel, NMPC Prague, Laos 2009, Expedi-

tion: M. Brancucci, M. Geiser, Z. Kraus, D. Hauck, V. Kubáň/ 914 Sericini Asia spec.” (NHMB). Paratypes: 1 ♂ “LAOS-NE, Xieng Khouang prov., 19°37–8'N, 103°20'E, Phonsavan (30km NE) Phou Sane Mt., 1420 m, 10-30.v.2009, Z. Kraus leg./ NHMB Basel, NMPC Prague, Laos 2009, Expedition: M. Brancucci, M. Geiser, Z. Kraus, D. Hauck, V. Kubáň/ 914 Sericini Asia spec.” (ZFMK).

**Description.** Length of body: 8.6 mm; length of elytra: 6.5 mm; maximum width: 5.3 mm. Surface of labroclipeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.68. Ratio of length of metepisternum/metacoxa: 1/1.73. Metatibia moderately long and wide, ratio width/length: 1/3.62; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 6A–C. Habitus: Fig. 6D.

Female unknown.

**Variation.** Length of body: 8.6–8.7 mm; length of elytra: 6.3–6.5 mm; maximum width: 5.2–5.3 mm.

**Diagnosis.** *Tetraserica xiengkhouangensis* sp. n. differs from the similar *T. damaidensis* by having the right paramere distinctly not wider (dorsal view) than the left one, and the left paramere short, one third as long as phallobase.

**Etymology.** The new species is named with reference to its occurrence in the Xieng Khouang province (adjective in the nominative singular).

### *Tetraserica doisangensis* Kobayashi, 2017

Brancucci & local coll. leg./ NHMB Basel, NMPC Prague Laos 2009 Expedition: M. Brancucci, M. Geiser, Z. Kraus, D. Hauck, V. Kubáň” (NHMB).

**Description.** Length of body: 6.5 mm; length of elytra: 5.4 mm; maximum width: 4.4 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.56. Ratio of length of metepisternum/metacoxa: 1/1.52. Metatibia moderately long and wide, ratio width/length: 1/3.45; basal group of dorsal spines of metatibia at first third of metatibial length.

**Figure 6.** **A–D** *Tetraserica xiengkhouangensis* sp. n. (holotype) **E–H** *T. doisangensis* Kobayashi, 2017 (Thailand: Doi Inthanon) **I–M** *T. curviforceps* sp. n. (holotype) **A, E, I** aedeagus, left side lateral view **C, G, L** aedeagus, right side lateral view **B, F, J** parameres, dorsal view **K** parameres, ventral view **D, H, M** habitus. Scale bars: 0.5 mm. Habitus not to scale.

Aedeagus: Fig. 6I–L. Habitus: Fig. 6M.

Female unknown.

**Variation.** Length of body: 6.5–7.8 mm; length of elytra: 5.4–6.0 mm; maximum width: 4.4–4.8 mm.

**Diagnosis.** *Tetraserica curviforceps* sp. n. differs from *T. sigulianshanica* Liu et al., 2014 by the distinctly finer and longer parameres. From *T. doisangensis* Kobayashi, 2017 it differs by the narrow median phallobasal apophysis and the strongly curved dorsal lobe of the right paramere.

**Etymology.** The species name (noun in apposition) is derived from the combined Latin words *curvus* (curved) and *forceps*, with reference to the shape of the curved right paramere.

### *Tetraserica miniatula* (Moser, 1915)

Figures 7, 56

*Neoserica miniatula* Moser, 1915: 171.

*Tetraserica miniatula*: Ahrens and Fabrizi 2016: 125.

**Type material examined.** Lectotype (here designated): ♂ “Pegu India/ Neoserica miniatula Type ♂ Moser” (ZMHB). Paralectotype: 1 ♀ “Pegu India/ Neoserica miniatula Type ♀ Moser” (ZMHB).

**Redescription.** Length of body: 8.0 mm; length of elytra: 5.8 mm; maximum width: 4.8 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes large, ratio of diameter/interocular width: 0.72. Ratio of length of metepisternum/metacoxa: 1/1.62. Metatibia moderately long and wide, ratio width/length: 1/3.07; basal group of dorsal spines of metatibia at first third of metatibial length.

Female: Antennal club with three antennomeres, as long as remaining antennomeres combined. Eyes smaller than in male, ratio of diameter/interocular width: 0.64. Pygidium flat.

Aedeagus: Fig. 7A–C. Habitus: Fig. 7D.

146 Sericini Asia spec.” (CPPB), 7 ♂♂ “NW Thailand, 19.19N, 97.59E, Mae Hong Son, 1991 Ban Huai Po, 1600–2000 m 17.-23.5., L. Dembicky leg.” (NHMW, ZFMK).

**Description.** Length of body: 7.6 mm; length of elytra: 5.9 mm; maximum width: 5 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.77. Ratio of length of metepisternum/metacoxa: 1/1.52. Metatibia moderately long and wide, ratio width/length: 1/3.38; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 8E–G. Habitus: Fig. 8H.

Female unknown.

**Variation.** Length of body: 7.6 mm; length of elytra: 5.8–5.9 mm; maximum width: 4.8–5 mm.

**Diagnosis.** *Tetraserica pluriuncinata* sp. n. differs from *T. bachmaensis* by the left paramere being split into two long branches (or lobes) and by having much longer median phallobasal apophysis.

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Greek word *pluris* (higher) and Latin word *uncinatus* (hooked), with reference to the pluri-hooked shape of the right paramere.

***Tetraserica sapana* sp. n.**

<http://zoobank.org/839700D2-1AB4-40DC-82A5-2A9900923CD7>

Figures 9, 51

**Type material examined.** Holotype: ♂ “Vietnam bor. Pr. Hoang lien son SA PA V.1990, J Picka lgt./ 908 Sericini Asia spec.” (NHMB).

**Description.** Length of body: 8.8 mm; length of elytra: 7.1 mm; maximum width: 5.5 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.6. Ratio of length of metepisternum/metacoxa: 1/1.31. Metatibia moderately long and wide, ratio width/length: 1/4.91; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 9A–D. Habitus: 9E.

Female unknown.

**Diagnosis.** *Tetraserica sapana* sp. n. is similar to *T. pluriuncinata* sp. n. in shape of male genitalia but differs from the latter by the shorter and simpler left paramere and the presence of trichome-like spines on the dorsal lobe of the right paramere.

**Etymology.** The new species is named after the type locality, Sa Pa (adjective in the nominative singular).

***Tetraserica setuliforceps* sp. n.**

<http://zoobank.org/73A2B365-28C8-4D42-9A0D-C548B98D9D28>

Figures 9, 56

**Type material examined.** Holotype: ♂ “NW Thailand, 19.19N, 97.59E, Mae Hong Son, 1991 Ban Huai Po, 1600–2000 m 9–16.5., L. Dembicky leg./ 130 Sericini Asia

spec.” (NHMW). Paratypes: 1 ♂ “NW Thailand, 19.19N, 97.59E, Mae Hong Son, 1991 Ban Huai Po, 1600–2000 m 17.-23.5., L. Dembicky leg.” (NHMW), 1 ♂ “NW Thailand: 7-12.V., Mae Hong Son distr. 1996 Soppong-pai; 19°27', 98°20', J. Horák lgt.; 1500 m leg./ coll. Pacholátko” (CPPB), 1 ♂ “NW Thailand 9.-16.V. Mae Hong Son 1991, Ban Huai Po, 1600 m, leg. P. Pacholátko/ coll. P. Pacholátko” (CPPB), 1 ♂ “NW THAI 7-14.V. DOI SUTHEP PUI 1300–1500 m 1992 leg. P. Pacholátko/ coll. P. Pacholátko” (CPPB), 1 ♂ “THAI 24-29.IV.1993, DOI SUTHEP Pacholátko & Dembicky leg/ coll. P. Pacholátko” (ZFMK).

**Description.** Length of body: 7.5 mm; length of elytra: 5.9 mm; maximum width: 4.6 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.59. Ratio of length of metepisternum/metacoxa: 1/1.68. Metatibia moderately long and wide, ratio width/length: 1/3.33; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 9F–H. Habitus: Fig. 9I.

Female unknown.

**Variation.** Length of body: 6.7–8.5 mm; length of elytra: 4.9–6.0 mm; maximum width: 4.5–5.0 mm.

**Diagnosis.** *Tetraserica setuliforceps* sp. n. resembles *T. changjiangensis* Liu et al., 2014 in the shape of aedeagus but it differs by the distinctly longer dorsal lobe of right paramere, which also bears trichome-like spines, and by the nearly straight left paramere.

**Etymology.** The species name (noun in apposition) is derived from the combined Latin words *setulus* (with small setae) and *forceps*, with reference to the setae present on the right paramere.

#### *Tetraserica parasetuliforceps* sp. n.

<http://zoobank.org/CD33C3EF-ECE2-4B03-BDA7-FDECC262B58E>

Figures 9, 49

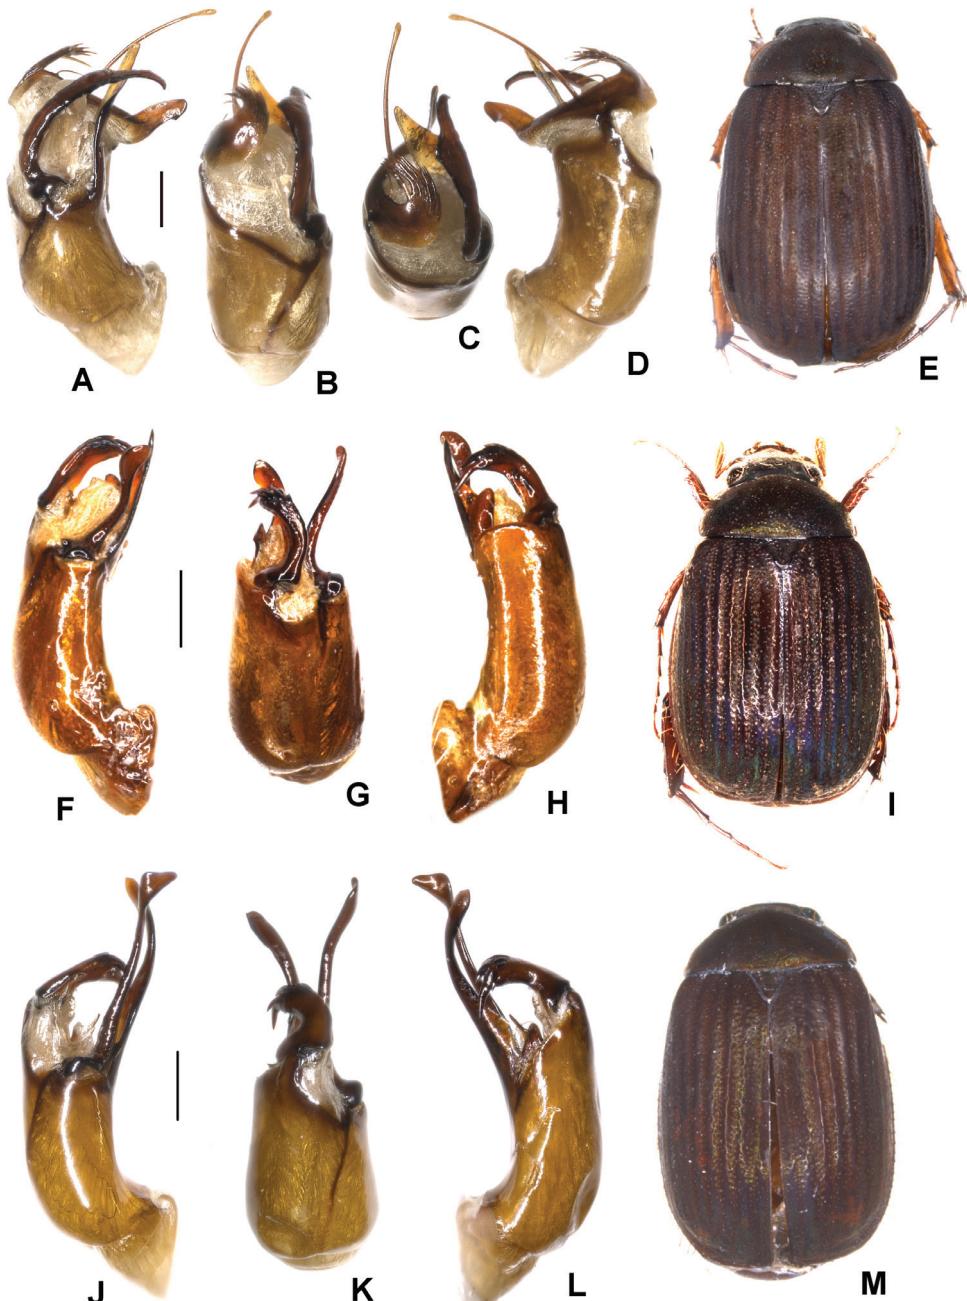

**Type material examined.** Holotype: ♂ “THAILAND, Prov. Tak, Doi Mussoi, 800 m a.V. 2010, leg. T. Ihle 16°45', 309'N, 98°55', 404'E/ 901 Sericini Asia spec.” (NME).

**Description.** Length of body: 7.6 mm; length of elytra: 6 mm; maximum width: 4.9 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.63. Ratio of length of metepisternum/metacoxa: 1/1.73. Metatibia short and wide, ratio width/length: 1/3; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 9J–L. Habitus: Fig. 9M.

Female unknown.

**Diagnosis.** *Tetraserica parasetuliforceps* sp. n. differs from *T. setuliforceps* sp. n. by the longer parameres, with the left paramere being as long as phallobase.

**Figure 9.** **A–E** *Tetraserica sapana* sp. n. (holotype) **F–I** *T. setuliforceps* sp. n. (holotype) **J–M** *T. parasetuliforceps* sp. n. (holotype) **A, F, J** aedeagus, left side lateral view **D, H, L** aedeagus, right side lateral view **B, G, K** parameres, dorsal view **C** parameres, distal view **E, I, M** habitus. Scale bars: 0.5 mm. Habitus not to scale.

**Etymology.** The species name (noun in apposition) is derived from the combined Greek prefix *para-* (near) and the species name *setuliforceps*, with reference to the similarity to the previous species.

***Tetraserica kollae* sp. n.**

<http://zoobank.org/44B57F67-EEEA-40A2-84AC-88416F684C8B>

Figures 10, 48

**Type material examined.** Holotype: ♂ “INDIA: Kolasib, Mizoram; 24°13'N, 92°40'E; K. Sreedevi 25.iv.2014/ 942 Sericini Asia spec.” (NBAIR). Paratype: 1 ♂ “INDIA: Kolasib, Mizoram; 24°13'N, 92°40'E; K. Sreedevi 25.iv.2014” (ZFMK).

**Description.** Length of body: 7.5 mm; length of elytra: 5.6 mm; maximum width: 4.8 mm. Surface of labroclipeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.67. Ratio of length of metepisternum/metacoxa: 1/1.48. Metatibia short and wide, ratio width/length: 1/3.21; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 10A–D. Habitus: Fig. 10E.

Female unknown.

**Variation.** Length of body: 7.5–7.8 mm; length of elytra: 5.6–5.8 mm; maximum width: 4.8–4.9 mm.

**Diagnosis.** *Tetraserica kollae* sp. n. is very similar to *T. brahmaputrae* Ahrens, 2004 in the shape of the genitalia; it differs from it by having a wider dorsal lobe of the right paramere, which is inserted more laterally on the right side, as well as the more strongly curved distal lobe of the right paramere.

**Etymology.** The new species is named after Dr Kolla Sreedevi, collector of the new species (noun in the genitive singular).

***Tetraserica jakli* sp. n.**

<http://zoobank.org/ EC8E05B1-BB73-49CA-8F4D-667A4DBBF269>

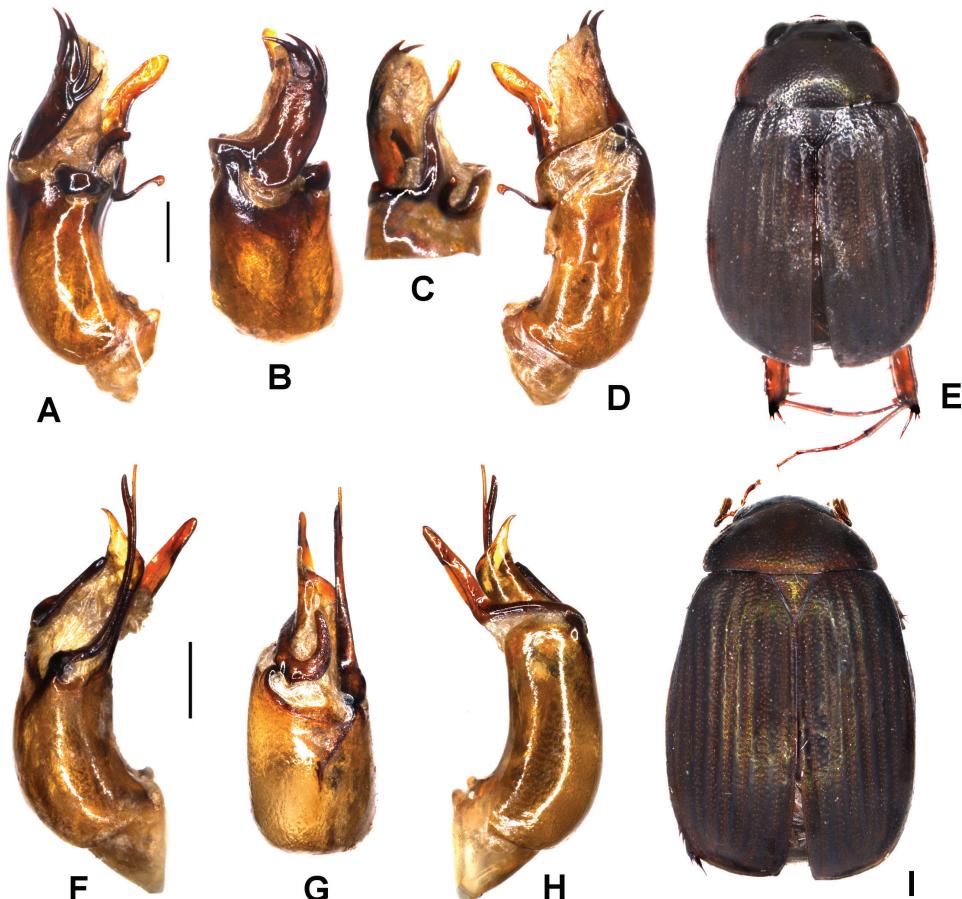

Figures 10, 49

**Type material examined.** Holotype: ♂ “Laos, Attapeau prov.; Annam Highlands Mts Dong Amphan; NBCA, ca. 1160 m NONG FA (crater lake) env.; 15°05.9'N, 107°25.6'E; St. Jakl lgt, 30.4.-6.5.2010/ 1012 Asia Sericini sp.” (ZFMK).

**Description.** Length of body: 7.3 mm; length of elytra: 5.6 mm; maximum width: 4.8 mm. Surface of labroclipeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.5. Ratio of length of metepisternum/metacoxa: 1/1.78. Metatibia short and wide, ratio width/length: 1/2.86; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 10F–H. Habitus: Fig. 10I.

Female unknown.

**Figure 10.** **A–E** *Tetraserica kollae* sp. n. (holotype) **F–I** *T. jakli* sp. n. (holotype) **A, F** aedeagus, left side lateral view **D, H** aedeagus, right side lateral view **B, G** parameres, dorsal view **C** parameres, ventral view **E, I** habitus. Scale bars: 0.5 mm. Habitus not to scale.

**Diagnosis.** The shape of aedeagus of *T. jakli* sp. n. is somewhat similar to that of *T. ferrugata* (Blanchard, 1850) from the Himalayas; the left paramere of the new species is, however, distinctly longer and distinctly split into two short filiform branches at apex.

**Etymology.** The new species is named after its collector, St. Jakl (noun in genitive singular).

***Tetraserica appendiculata* sp. n.**

<http://zoobank.org/C694F1B9-EA18-4A1D-BA35-5C9D29021ADE>  
Figures 11, 46

**Type material examined.** Holotype: ♂ “X-DA4795 labcode: VD100, LAOS, Stupa GH, 5 km W Muang Sing, 750 m, 21.1482N 101.1711E, 9.v-2.vi.2011, M. Murzin,

O. Shulga leg. Tetraserica spLA\_V59/ sp-LA-v59/ X-DA4795" (ZFMK). Paratype: 1 ♂ "Laos, 21°09'N, 101°19'E, Louangnamtha pr. Namtha->Muang Sing, 5-31.v.1997, 900-Vit. Kubáň leg. -1200 m/ Coll. P. Pacholátko/ LS57" (CPPB).

**Description.** Length of body: 8.8 mm; length of elytra: 6.5 mm; maximum width: 5.3 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.65. Ratio of length of metepisternum/metacoxa: 1/1.52. Metatibia short and wide, ratio width/length: 1/3.21; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 11A–D. Habitus: Fig. 11E.

Female unknown.

**Variation.** Length of body: 7.8–8.8 mm; length of elytra: 5.9–6.5 mm; maximum width: 5.0–5.3 mm.

**Diagnosis.** The shape of aedeagus of *T. appendiculata* sp. n. is very similar to that of *T. menseana* Liu et al., 2014; the new species differs in having one filiform sub-branch of the left paramere reduced, being much shorter than the width of principal branch at apical third.

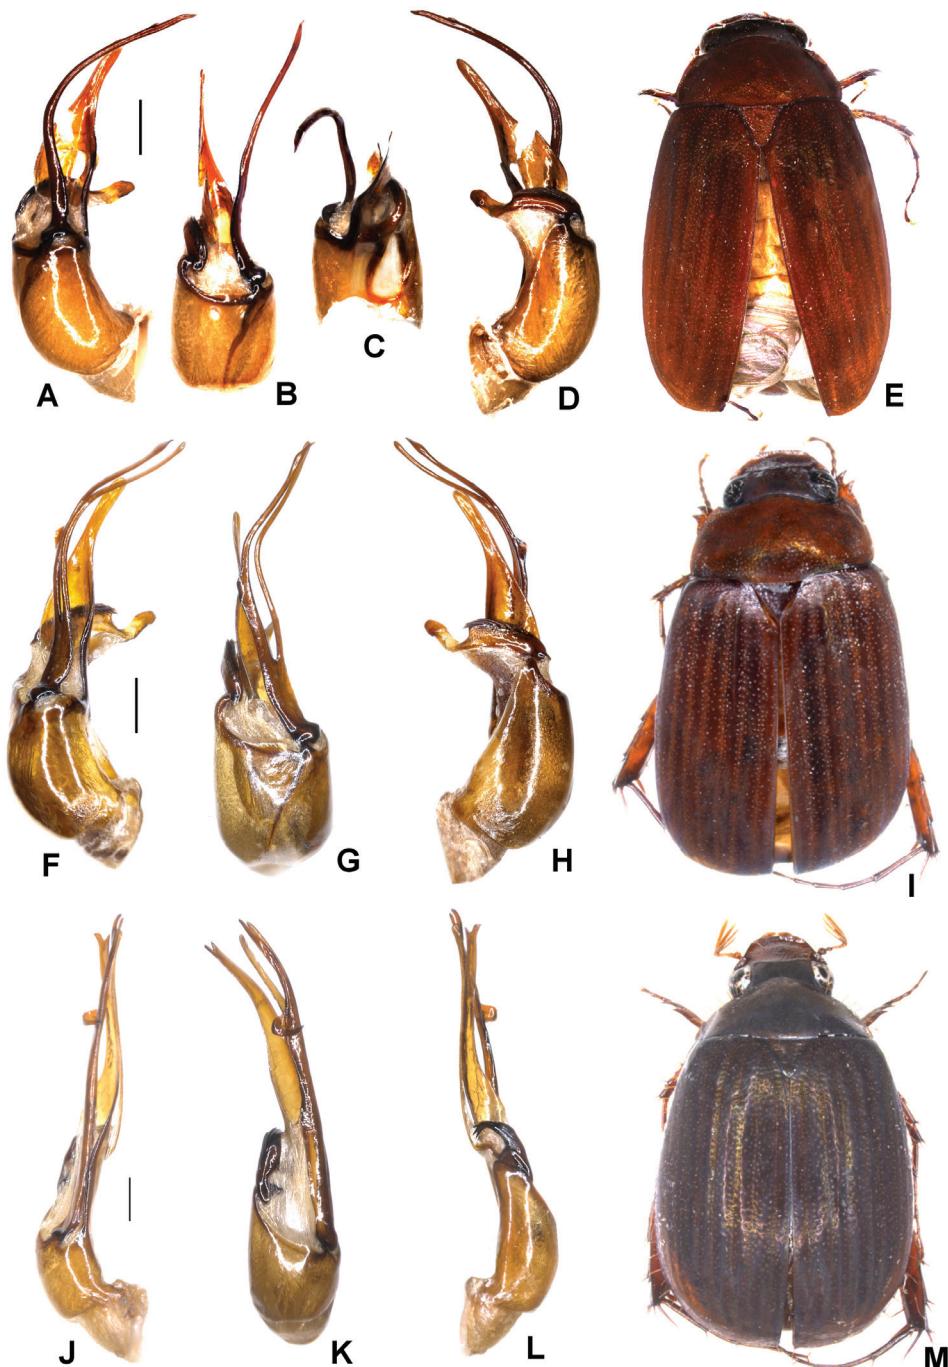

**Etymology.** The species name (adjective in the nominative singular) is derived from the Latin word *appendiculus* (small appendage), with reference to the small appendix of the paramere.

### *Tetraserica allomenseana* sp. n.

<http://zoobank.org/1EFA30B9-2618-4324-A6E0-2EB5318CBFFF>

Figures 11, 46

**Type material examined.** Holotype: ♂ "NE-Laos: Houa Phan prov.; Ban Saleui, Phou Pan (Mt.)- 20°12'N, 104°01'E, 11.iv.-15.v.2012, 1300–1900 m leg. C. Scale bars: 0.5 mm. Habitus not to scale.

Kubáň leg./ 202 Sericini Asia spec.” (CPPB), 1 ♂ “Laos-NE, Houa Phan prov., 20°13'09–19"N, 103°59'54” – 104°00'03"E, 1480–1550 m, Phou Pane Mt., 1.-16. vi.2009, Zdeněk Kraus leg./ NHMB Basel, NMPC Prague Laos 2009 Expedition: M. Brancucci, M. Geiser, Z. Kraus, D. Hauck, V. Kubán” (NHMB).

**Description.** Length of body: 8.9 mm; length of elytra: 6.6 mm; maximum width: 5.0 mm. Surface of labroclipeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes large, ratio of diameter/interocular width: 0.7. Ratio of length of metepisternum/metacoxa: 1/1.65. Metatibia moderately long and wide, ratio width/length: 1/3.36; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 11F–H. Habitus: Fig. 11I.

Female unknown.

**Variation.** Length of body: 8.1–9.1 mm; length of elytra: 5.6–6.9 mm; maximum width: 4.8–5.3 mm.

**Diagnosis.** The shape of aedeagus of *T. allomengeana* sp. n. is very similar to that of *T. mengeana* Liu et al., 2014; the new species differs by the filiform branches of left paramere being approximately two thirds of the paramere length, and by having the median phallobasal lamina evenly narrowed towards apex, rather than being narrow for most of its distal part as in *T. mengeana*.

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Greek word *allo-* (other) and the species name *mengeana*, with reference to the similarity to *T. mengeana*.

### *Tetraserica quadrifurcata* sp. n.

<http://zoobank.org/16DE05DE-9B95-4091-AA27-6E973A907E0E>

Figures 11, 50

**Type material examined.** Holotype: ♂ “Cambodia: Kirirom Nat. Park, h = 650 m, 11°18'6"N, 104°5'40"E, 9-16.XII.1999 leg. M. & S. Murzin/ coll. D. Ahrens/ 117 Sericini Asia spec.” (ZFMK). Paratype: 1 ♂, 1 ♀ “Thailand, Khao Yai; at light, 15.VII.1991; leg. M. Tanida” (ZFMK).

**Description.** Length of body: 8.9 mm; length of elytra: 6.8 mm; maximum width: 5.6 mm. Surface of labroclipeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.62. Ratio of length of metepisternum/metacoxa: 1/1.67. Metatibia moderately long and wide, ratio width/length: 1/3.33; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 11J–L. Habitus: 11M.

**Variation.** Length of body: 8.9–9.8 mm; length of elytra: 6.8–7.0 mm; maximum width: 5.5–5.6 mm. Female: Eyes as large as in male; antennal club composed of four antennomeres, basal joint of club one quarter as long as club.

**Diagnosis.** *Tetraserica quadrifurcata* sp. n. differs from all other *Tetraserica* species by its long median phallobasal apophysis having the median phallobasal lamina bifurcate at apex.

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Latin prefix *quadri* (four) and *furcata* (forked), with reference to the shape of doubly bifurcate parameres.

***Tetraserica siantarensis* (Moser, 1922), comb. n.**

Figures 12, 50

*Neoserica siantarensis* Moser, 1922: 104.

**Type material examined.** Lectotype (here designated): ♂ “Fort de Kock (Sumatra) 920 m Januari 1922 leg. E. Jacobson/ *Neoserica siantarensis* Mos. [handwritten by Moser] det. J. Moser 1926 [handwritten by curator?]” (ZMAN). Paralectotype: 1 ♀ “Fort de Kock (Sumatra) 920 m Januari 1922 leg. E. Jacobson/ *Neoserica siantarensis* Mos. [handwritten by Moser]/ det. J. Moser 1926 [handwritten by curator?]” (ZMAN).

**Additional material examined.** 2 ♂♂, 1 ♀ “Malaysia W, Kelantan 40 km N of Gua Musang Gunung Berangkat Kampong Riek; 1100 m, 15.v.-8.vi.2017 Petr Cechovsky lgt.” (NME), 1 ♂, 1 ♀ “W-Sumatra Payakumbuh Sarilamak env. 15.-16.2.91 Jezevec lgt.” (ZFMK), 1 ♂ “Indonesia W, Sumatra, Harau Valley, Payakumbuh near Bukit Tinggi, XI.1993-IV.1994, Sarimudanas leg.” (ZFMK), 1 ♂, 1 ♀ “Indonesia Sumatra Utara Sungai Kopas II, ca 60 km E Pematangsiantar ca. 300 m, Sekundärwald 25.03.1997, leg.C U. frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.43. Ratio of length of metepisternum/metacoxa: 1/1.42. Metatibia short and wide, ratio width/length: 1/3.08; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 12I–K. Habitus: Fig. 12L.

Female unknown.

**Diagnosis.** *Tetraserica rubrithorax* sp. n. differs from all other known *Tetraserica* species by having the body blackish brown and pronotum reddish.

**Etymology.** The species name (noun in apposition) is derived from the combined Latin words *rubus* (red) and *thorax*, with reference to the red pronotum of the species.

### *Tetraserica falciforceps* sp. n.

<http://zoobank.org/9DDFDF2A-A586-4A0B-A7C1-EE9AA5098F2D>

Figures 13, 48

**Type material examined.** Holotype: ♂ “NE-Laos: Houa Phan prov.; Ban Saleui, Phou Pan (Mt.)- 20°12'N, 104°01'E, 11.iv.-15.v. 2012, 1300–1900 m leg. C. Holzschuh - ZFMK Ankauf 2012/ sp 37 Silvia Indochina” (ZFMK). Paratypes: 2 ♂♂, 2 ♀♀ “NE-Laos: Houa Phan prov.; Ban Saleui, Phou Pan (Mt.)- 20°12'N, 104°01'E, 11.iv.-15.v. 2012, 1300–1900 m leg. C. Holzschuh - ZFMK Ankauf 2012” (ZFMK), 1 ♂ “NE-Laos: Houa Phan prov.; Ban Saleui, Phou Pan (Mt.)- 20°12'N, 104°01'E, 1300–1900 m 01.-31.5.2011, leg. C. Holzschuh - ZFMK Ankauf 2012” (ZFMK), 4 ♂♂ “C. Vietnam: Thanhhoa prov., Langchan, 300 m, 17.-18.IV.1963, leg. O. Kabakov” (ZIN, ZFMK), 1 ♂ “N Vietnam 1986 prov. Ha son binh Hoa Binh 5.-7.7. V. Shliva lgt.” (NHMB).

**Description.** Length of body: 6.9 mm; length of elytra: 5.1 mm; maximum width: 4.5 mm. Dorsal surface blackish, ventral surface reddish brown. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.44. Ratio of length of metepisternum/metacoxa: 1/1.44. Metatibia moderately long and wide, ratio width/length: 1/3.8; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 13A–C. Habitus: Fig. 13D.

**Variation.** Length of body: 6.9–7.5 mm; length of elytra: 5.1–5.9 mm; maximum width: 4.5–5.2 mm. Female: Eyes as large as in male; antennal club composed of three joints, short, as long as remaining antennomeres combined.

**Diagnosis.** *Tetraserica falciforceps* sp. n. is rather similar to *T. sigulianshanica* Liu et al., 2014 in shape of the aedeagus; the new species differs by the straight left paramere not being widened at apex and by the longer and widely arched dorsal lobe of the right paramere.

**Etymology.** The species name (noun in apposition) is derived from the combined Latin words *falcis* (sickle) and *forceps*, with reference to setae present to the sickle-shaped right paramere.

***Tetraserica olegi* sp. n.**

<http://zoobank.org/628E8513-AA4F-48E2-813F-621927C4E6B1>

Figures 13, 50

**Type material examined.** Holotype: ♂ “N. Vietnam: 40 km NE Thainguyen, 300 m, 14.V.1963, leg. O Kabakov” (ZIN).

**Description.** Length of body: 6.8 mm; length of elytra: 5.6 mm; maximum width: 0.1 mm. Dorsal surface blackish, ventral surface reddish brown. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.42. Ratio of length of metepisternum/metacoxa: 1/1.56. Metatibia short and wide, ratio width/length: 1/3.14; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 13E–G. Habitus: Fig. 13H.

Female unknown.

**Diagnosis.** The new species is very similar to the Chinese species *T. longzhouensis* Liu et al., 2014, but differs by the wider apical lobe of its left paramere.

**Etymology.** The new species is named after Oleg N Kabakov (1928–2009).

***Tetraserica smetsi* sp. n.**

<http://zoobank.org/D76D8280-422B-45F9-B26D-3E59E5051088>

Figures 14, 51

**Type material examined.** Holotype: ♂ “Coll. I. R. Sc. N. B., Cambodia, Pursat prov., Phnom Samkos W.S. forest edge, light trap 14.iv.2005 Leg. K. Smets & I. Var” (ISNB). Paratypes: 2 ♂♂ “Coll. I. Pacholátko)" (CPPB)

**Description.** Length of body: 9.8 mm; length of elytra: 7.5 mm; maximum width: 6.1 mm. Surface of labroclipeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.66. Ratio of length of metepisternum/metacoxa: 1/1.78. Metatibia short and wide, ratio width/length: 1/3.18; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 15A–C. Habitus: Fig. 15D.

Female unknown.

**Variation.** Length of body: 8.6–9.8 mm; length of elytra: 6.5–7.5 mm; maximum width: 5.5–6.1 mm.

**Diagnosis.** *Tetraserica konchurangensis* sp. n. is very similar to *T. shangsiensis* Liu et al., 2014, *T. namnãoensis* sp. n., and *T. smetsi* sp. n. in shape of the aedeagus. *Tetraserica konchurangensis* sp. n. differs from all three by the left paramere lacking a tiny tooth before the apex.

**Etymology.** The new species is named with reference to its occurrence in the Kon Chu Rang Nature Reserve (adjective in the nominative singular).

***Tetraserica angkorwatensis* sp. n.**

<http://zoobank.org/B830AF1C-2AD5-4B33-ADFF-BDE63DF04610>

Figures 15, 47

**Type material examined.** Holotype: ♂ “Coll. I. R. Sc. N. B. Cambodia: Siem Reap prov. Forest S of Angkor Wat 26-IV-2005, Light Trap, Leg K. Smets & I. Var/ 904 Sericini Asia spec.” (ISNB). Paratypes: 4 ♂♂ “Coll. I. R. Sc. N. B. Cambodia: Siem Reap prov. Forest S of Angkor Wat 26-IV-2005, Light Trap, Leg K. Smets & I. Var” (ISNB, ZFMK).

**Description.** Length of body: 7.5 mm; length of elytra: 5.9 mm; maximum width: 4.9 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.68. Ratio of length of metepisternum/metacoxa: 1/1.79. Metatibia short and wide, ratio width/length: 1/3.07; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 15E–G. Habitus: Fig. 15H.

Female unknown.

**Variation.** Length of body: 7.5–7.8 mm; length of elytra: 5.8–5.9 mm; maximum width: 4.9–5.0 mm.

**Diagnosis.** *Tetraserica angkorwatensis* sp. n. is rather similar to *T. gestroi* (Brenske, 1898) in shape of aedeagus; the new species differs by having the median lamina of the phallobase curved at its apex dorsally, while the base of the left paramere is not extended ventrally.

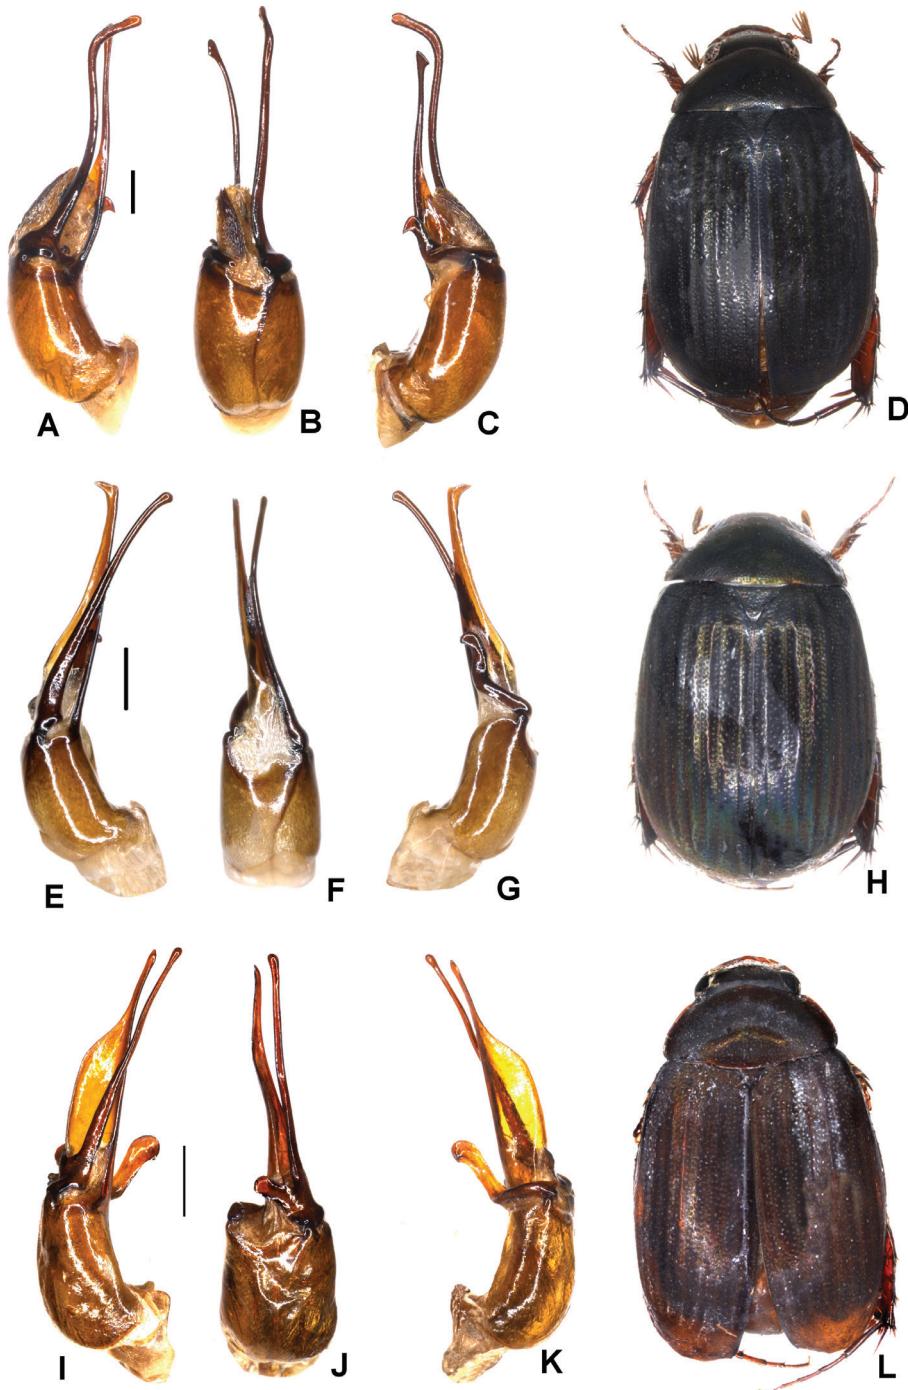

**Etymology.** The new species is named after the type locality, Angkor Wat (adjective in the nominative singular).

***Tetraserica koi* sp. n.**

<http://zoobank.org/CB4B777E-146A-440B-B689-03CA74A504FC>

Figures 15, 48

Olexa/ Fer-eiwilliger Museumsverain (Basel) 1989” (NHMB), 1 ♂ “N-Vietnam, (Tonkin) Tam-dao 12-24.5.1989 PACHOLÁTKO leg./ coll. P. Pacholátko/ VS21/ 242 Sericini Asia spec.” (CPPB), 1 ♂ “Vietnam, Tam dao 27.5.-2.6.1986 Vinh phu prov. Jan Horák lgt.” (NHMB), 2 ♂♂ “N-Vietnam 5-10.VI.1989 Tam Dao Brantlová lgt.” (NHMB), 1 ♂ “N. Vietnam: Vinh Phu prov., Tam Dao 900 m, 14.V.1962 leg. O. Kabakov” (ZIN).

**Description.** Length of body: 9.9 mm; length of elytra: 7 mm; maximum width: 6.1 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.65. Ratio of length of metepisternum/metacoxa: 1/1.26. Metatibia short and wide, ratio width/length: 1/2.6; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 17A–D. Habitus: Fig. 17E.

Female unknown.

**Variation.** Length of body: 8.0–9.9 mm; length of elytra: 6.2–7.0 mm; maximum width: 5.0–6.1 mm.

**Diagnosis.** *Tetraserica quadriforceps* sp. n. differs from all other *Tetraserica* species with a median lamina of the phallobase that is longer than the half-length of phallobase (but not exceeding the length of it), and by the right paramere having a comb of short spines at base. The shape of aedeagus resembles that of *T. changshouensis* Liu et al., 2014, but the medial phallobasal lamina is much shorter and the apex of the right paramere less strongly widened.

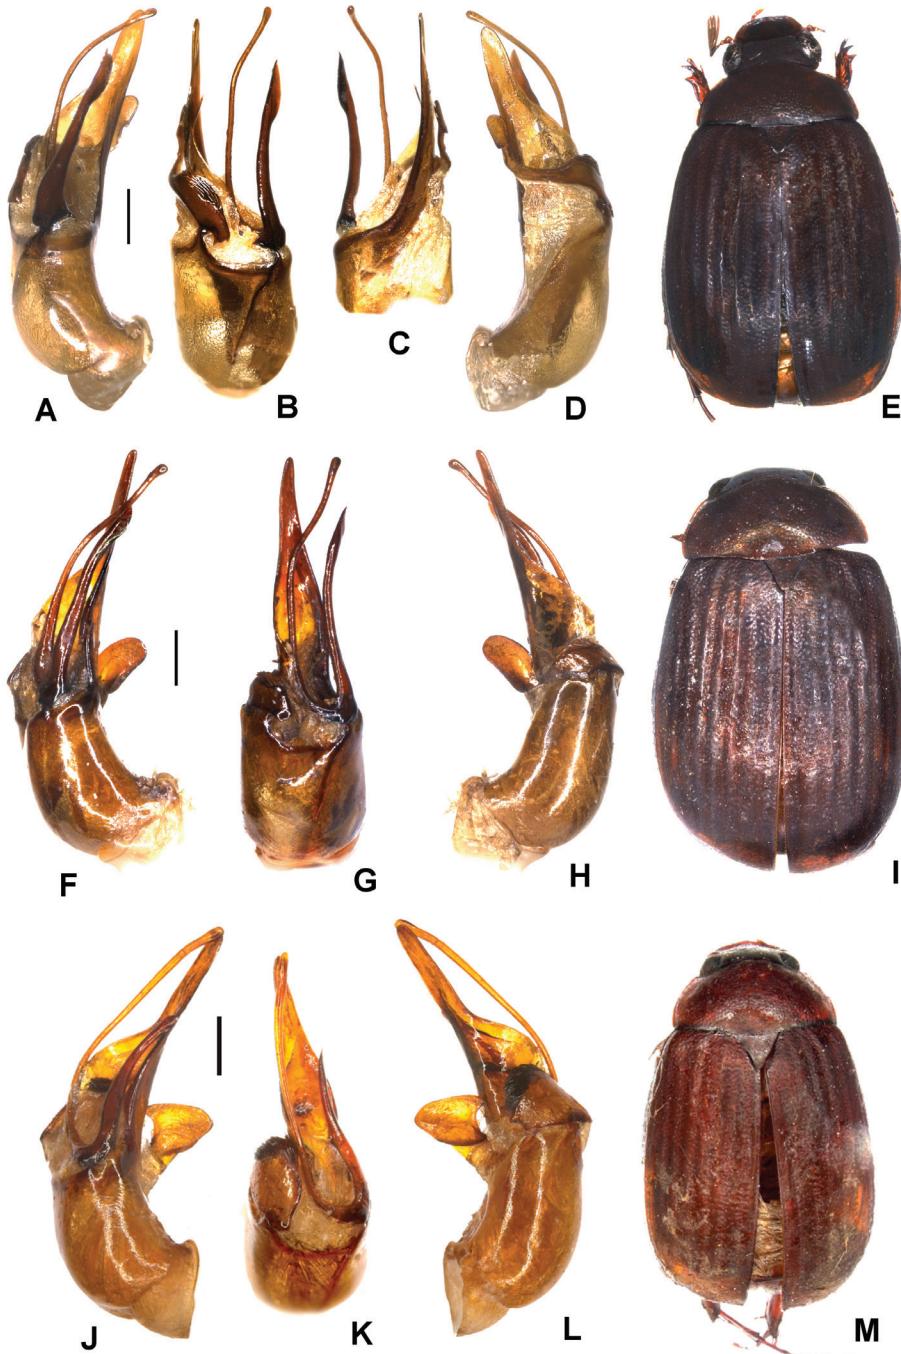

**Etymology.** The species name (noun in apposition) is derived from the combined Latin prefix *quadri* (four) and *forceps*, with reference to the four branches of the parameres.

***Tetraserica allochangshouensis* sp. n.**

Scale bars: 0.5 mm. Habitus not to scale.

**Description.** Length of body: 8.8 mm; length of elytra: 6.6 mm; maximum width: 5.6 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.56. Ratio of length of metepisternum/metacoxa: 1/1.5. Metatibia short and wide, ratio width/length: 1/3.27; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 17F–H. Habitus: Fig. 17I.

Female unknown.

**Diagnosis.** The new species is close to the Chinese species *T. changshouensis* Liu et al., 2014, but differs by the narrower ventroapical lobe of right paramere and the longer ventral lobe of left paramere.

**Variation.** Length of body: 8.2–8.8 mm; length of elytra: 6.5–6.6 mm; maximum width: 5.0–5.6 mm.

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Greek prefix *allo-* (other) and the species name *changshouensis*, with reference to the similarity to *T. changshouensis*.

Horak lgt./ Coll. Milan Nikodym Praha” (ZFMK), 3 ♂♂, 1 ♀ “Birmania Lashio VI-53 Bentoglio” (MSNM).

**Description.** Length of body: 9 mm; length of elytra: 5.8 mm; maximum width: 5.8 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.71. Ratio of length of metepisternum/metacoxa: 1/1.72. Metatibia short and wide, ratio width/length: 1/2.05; basal group of dorsal spines of metatibia at first third of metatibial length. Ventral terminal spine of metatibia distinctly longer than first metatarsomere.

Aedeagus: Fig. 19I–K. Habitus: Fig. 19L.

**Variation.** Length of body: 9.0–9.9 mm; length of elytra: 5.8–7.0 mm; maximum width: 5.5–5.8 mm. Female: Eyes as large as in male; antennal club composed of three antennomeres, as long as remaining antennomeres combined.

**Diagnosis.** Aedeagus of *Tetraserica spinotibialis* sp. n. resembles that of *T. ruiliensis* Liu et al., 2014 in shape. The new species differs by the ventral terminal spine of metatibia being distinctly longer than first metatarsomere, as well as by the right paramere being more strongly bent in the middle in lateral view.

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Latin words *spina* and *tibialis*, with reference to the strongly developed spine of the mesotibia.

length of metepisternum/metacoxa: 1/1.69. Metatibia short and wide, ratio width/length: 1/2.62; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 20A–C. Habitus: Fig. 20D.

Female unknown.

**Variation.** Length of body: 10.4–11.2 mm; length of elytra: 8.0–8.1 mm; maximum width: 6.6–6.9 mm.

**Diagnosis.** *Tetraserica vari* sp. n. differs from all other *Tetraserica* species in having a long median phallobasal lamina, a basally bent left paramere, and the median phallobasal lamina widened and sharply truncated at its apex.

**Etymology.** The new species is named after one of its collectors, I Var (noun in genitive singular).

#### *Tetraserica constanti* sp. n.

<http://zoobank.org/5A39A989-5418-424B-8599-0464458530C1>

Figures 20, 48

**Type material examined.** Holotype: ♂ “Coll. I. R. Sc. N. B. Cambodia - 8 km north of Sre Noi (road to Along Vaeng)/ Light trap 29.V.2003 Leg. J. Constant & K. Smets/ 926 Sericini Asia spec.” (ISNB). Paratype: 1 ♂ “Coll. I. R. Sc. N. B. Cambodia (Siem Road prov) Kbal Spean, Light Trap 28 V 2005 Leg Var & Grootaert” (ZFMK).

**Description.** Length of body: 9.8 mm; length of elytra: 7.5 mm; maximum width: 6.5 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.63. Ratio of length of metepisternum/metacoxa: 1/1.79. Metatibia short and wide, ratio width/length: 1/2.57; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 20E–G. Habitus: Fig. 20H.

Female unknown.

**Variation.** Length of body: 9.8–10.2 mm; length of elytra: 7.3–7.5 mm; maximum width: 6.2–6.5 mm.

**Diagnosis.** *Tetraserica constanti* sp. n. is very similar to *T. vari* sp. n. in the shape of aedeagus but differs by the distinctly shorter median phallobasal lamina and parameres.

**Etymology.** The new species is named after one of its collectors, J Constant (noun in genitive singular).

#### *Tetraserica vientianeensis* sp. n.

<http://zoobank.org/D7FA5448-3EDC-4924-AF48-C298C86BF208>

Figures 20, 54

**Type material examined.** Holotype: ♂ “Laos Bolikhhamxai pr., 18°16'N, 103°11'E, 70 km NEE Vientiane 27-30.iv.1997, 150 m, Vít Kubáň leg./ coll. P. Pacholátko/ 197 Sericini Asia spec.” (CPPB).

**Description.** Length of body: 8.3 mm; length of elytra: 6 mm; maximum width: 4.9 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.64. Ratio of length of metepisternum/metacoxa: 1/1.65. Metatibia short and wide, ratio width/length: 1/2.93; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 20I–K. Habitus: Fig. 20L.

Female unknown.

**Diagnosis.** *Tetraserica vientianeensis* sp. n. differs from the similar *T. constanti* sp. n. by the basally straight and unbent left paramere, and by the median lamina of phallopase which is not widened at apex.

**Etymology.** The new species is named with reference to its close occurrence to the city of Vientiane (adjective in the nominative singular).

***Tetraserica breviforceps* sp. n.**

<http://zoobank.org/F5BB7D81-329D-435F-8F0D-CE381D5D25B6>

Figures 21, 47

**Type material examined.** Holotype: ♂ “Laos, Sekong Prov. ca. 12 km S Sekong TAD FAEK Waterfalls (at light) 15°14, 7'N, 106° 45, 1'E, 118m, Jiří Hájek leg., 8+12.v.2010/ 207 Sericini Asia spec.” (NMPC). Paratype: 1 ♂ “Laos centr., Khammouan prov. NAKAI env. 4-8.5.1998, Route No 8, alt. 560 ± 20 m, N17°42.8, E 105°08.9 (GPS), E Jendek & O Šauša leg./ coll. P Pacholátko” (CPPB), 1 ♂ “Laos, Sekong Prov. ca. 12 km S Sekong TAD FAEK Waterfalls (at light) 15°14, 7'N, 106° 45, 1'E, 118 m, Jiří Hájek leg. 8+12.v.2010/ 207 Sericini Asia spec.” (ZFMK).

**Description.** Length of body: 8 mm; length of elytra: 6 mm; maximum width: 5.6 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.74. Ratio of length of metepisternum/metacoxa: 1/2.08. Metatibia short and wide, ratio width/length: 1/2.44; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 21A–C. Habitus: Fig. 21D.

Female unknown.

**Variation.** Length of body: 8.0–9.2 mm; length of elytra: 6.0–6.5 mm; maximum width: 5.5–5.6 mm.

**Diagnosis.** *Tetraserica breviforceps* sp. n. differs from all other *Tetraserica* species with its short parameres and very short median phallobasal lamina, and by the left paramere having a robust (nearly half as long as paramere), subsphaerical, and apically convex dorsal lobe at its base.

**Etymology.** The name of the new species (noun in apposition) is derived from the combined Latin words *brevis* (short) and *forceps*, with reference to the short parameres.

***Tetraserica nahaeoensis* sp. n.**

Metatibia short and wide, ratio width/length: 1/3.12; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 21E–G. Habitus: Fig. 21.

Female unknown.

**Variation.** Length of body: 8.4–9.6 mm; length of elytra: 6.5–6.9 mm; maximum width: 5.9–6.0 mm.

**Diagnosis.** *Tetraserica nahaeoensis* sp. n. differs from all other *Tetraserica* species in having a moderately long median phallobasal lamina being narrowed distally, curved dorsally, and having a dorsal tooth at apex; simple left parameres, the shorter right paramere (being one third as long as phallobase), the nearly straight left paramere.

**Etymology.** The new species is named after the type locality, Na-Haeo (adjective in the nominative singular).

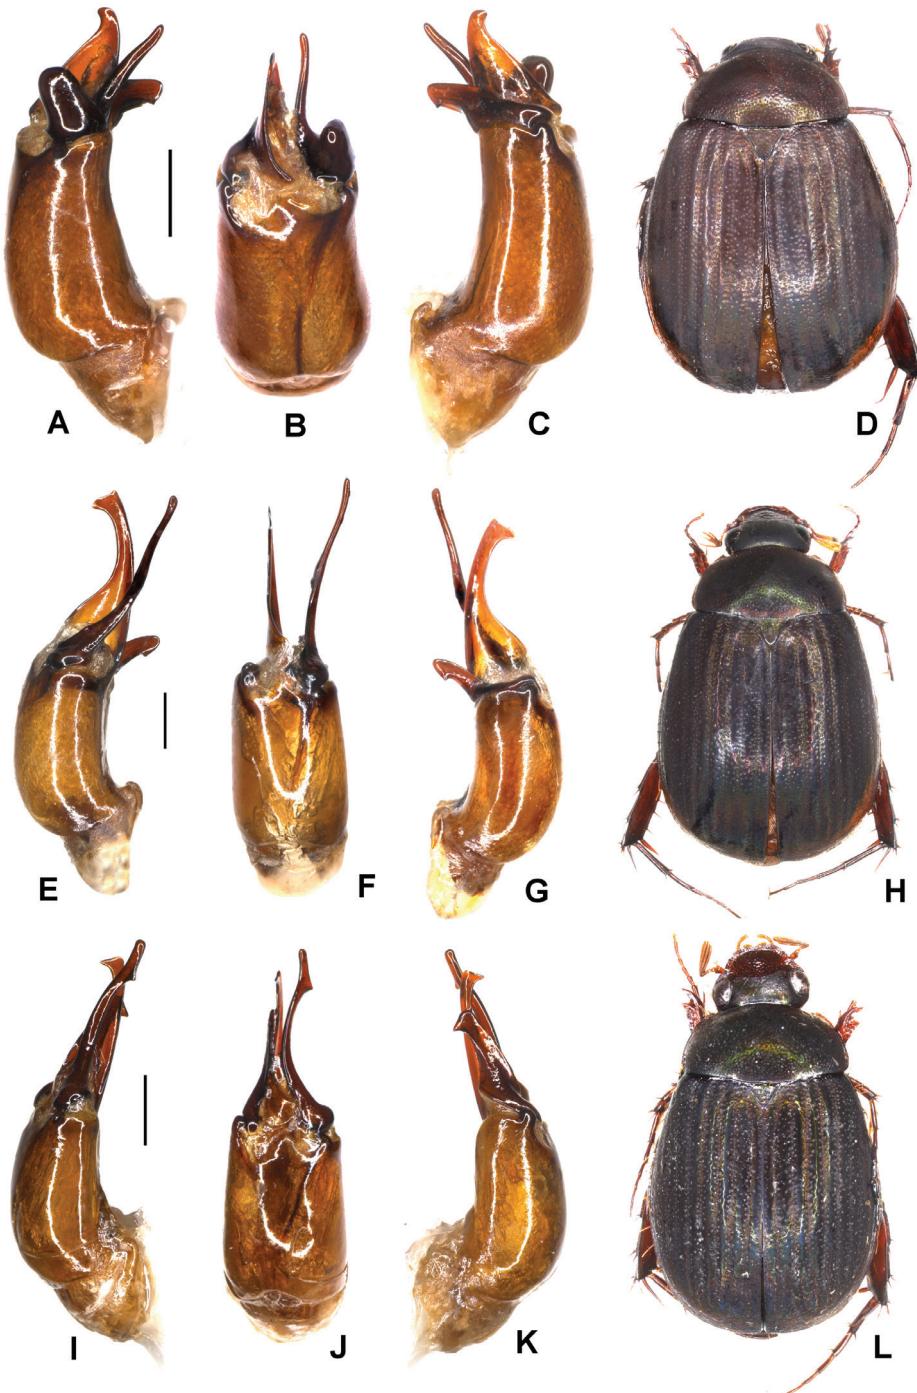

***Tetraserica champassakana* sp. n.**

<http://zoobank.org/29A7B159-942A-4762-A24C-394BCE2F9DA8>

Figures 21, 46

**Type material examined.** Holotype: ♂ “Laos, Champassak Prov., Dong Hua Xao NBCA bank of Nam Phak river, 15°59'N, 105°55'E/ 280 m, at light, No. 14, 28-29. III.1998 leg. O Merkl & G Csorba” (HNHM). Paratype: 1 ♂ “Laos, Champassak Prov., Dong Hua Xao NBCA bank of Nam Phak river, 15°59'N, 105°55'E/ 280 m, at light, No. 14, 28-29.III.1998 leg. O Merkl & G Csorba” (ZFMK).

**Description.** Length of body: 8.8 mm; length of elytra: 5.9 mm; maximum width: 5.3 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to

**Figure 21.** **A–D** *Tetraserica breviforceps* sp. n. (holotype) **E–H** *T. nahaeoensis* sp. n. (holotype) **I–L** *T. champassakana* sp. n. eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.5. Ratio of length of metepisternum/metacoxa: 1/1.73. Metatibia short and wide, ratio width/length: 1/2.93; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 21I–K. Habitus: Fig. 21L.

Female unknown.

**Variation.** Length of body: 7.2–8.8 mm; length of elytra: 5.4–5.9 mm; maximum width: 4.5–5.3 mm.

**Diagnosis.** *Tetraserica champassakana* sp. n. is rather similar to *T. nahaeoensis* sp. n. in the shape of the aedeagus but differs by the longer right paramere being half as long as phallobase.

**Etymology.** The new species is named with reference to its occurrence in Champassak province (adjective in the nominative singular).

#### *Tetraserica cattienensis* sp. n.

<http://zoobank.org/244038AC-E7EE-4531-AA94-7439E68B0D81>

Figures 22, 46

**Type material examined.** Holotype: ♂ “Museum Leiden Viet Nam (Dong Nai Prov.) Cát Tiên NP: Ficus trail. 9-26.iv.2007. leg. May Phu Quy, Nguyen Than Mahn/ humid lowland forest; in malaise traps; 250 m 11°26'20, 6°N, 107°25'42"E” (RMNH). Paratypes: 1 ♂ “Museum Leiden Viet Nam (Dong Nai Prov.) Cát Tiên N.P.: Ficus trail. 9-26.iv.2007. leg. May Phu Quy, Nguyen Than Mahn/ humid lowland forest; in malaise traps; 250 m 11°26'20, 6°N, 107°25'42"E” (ZFMK), 1 ♂ “Museum Leiden Viet Nam (Dong Nai Prov.) Cát Tiên N.P.: Ficus trail. 10.iv-15.v.2007. Leg. May Phu Quy, Nguyen Than Mahn/ humid lowland forest; in malaise traps; 250 m. 11°26'20, 6°N, 107°25'42"E” (RMNH), 1 ♂ “S Vietnam, 1-5.5.1994 Nam Cat Tien Nat. park P. Pacholátko & L. Dembický leg./ coll. P. Pacholátko/VS 118” (CPPB).

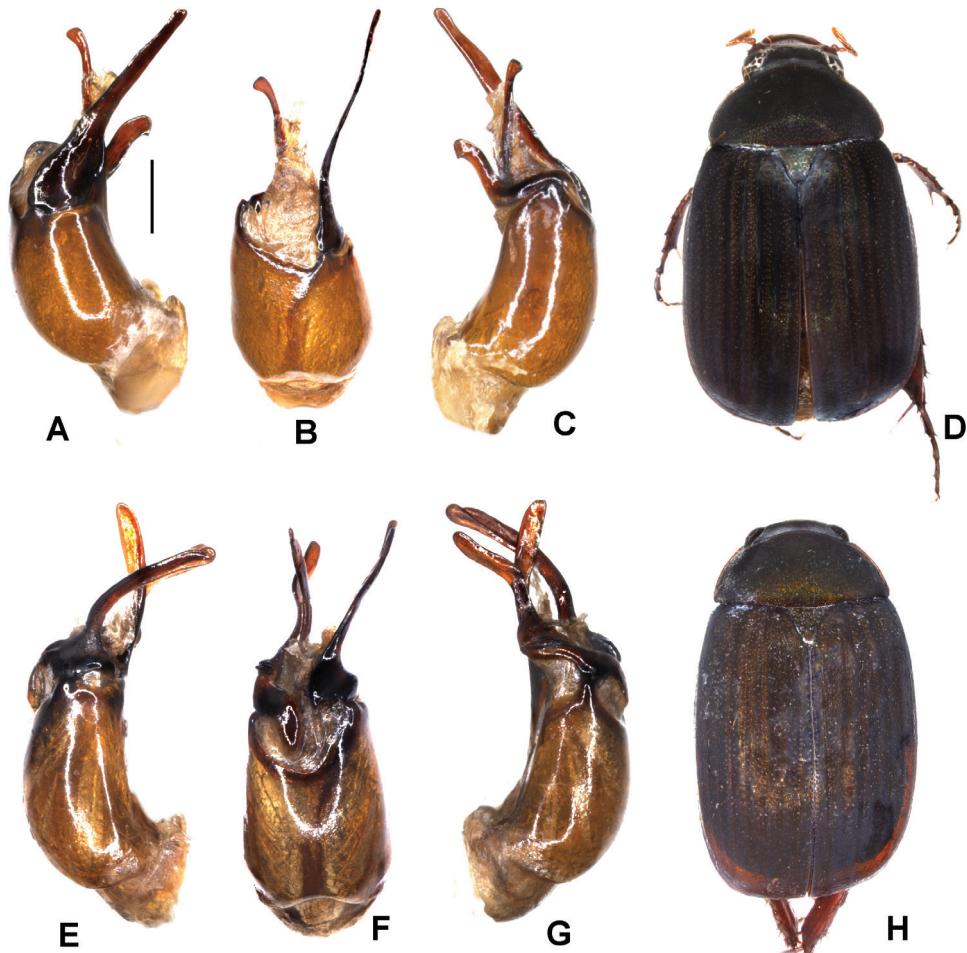

**Description.** Length of body: 8.4 mm; length of elytra: 6 mm; maximum width: 5 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.67. Ratio of length of metepisternum/metacoxa: 1/1.61. Metatibia short and wide, ratio width/length: 1/2.35; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 22A–C. Habitus: Fig. 22D.

Female unknown.

**Variation.** Length of body: 7.9–8.4 mm; length of elytra: 5.9–6 mm; maximum width: 4.9–5.0 mm.

**Diagnosis.** *Tetraserica cattienensis* sp. n. differs from all other *Tetraserica* species in having a straight or slightly convex posterior margin of the metafemur, small eyes, and the short median phallobasal lamina being half as long as phallobase. From the similar *T. bansanpakiana* sp. n. and *T. margheritae* sp. n., *T. cattienensis* sp. n. differs by the robust spines on the ventral margin of metatibia being subequal in length.

**Figure 22.** **A–D** *Tetraserica cattienensis* sp. n. (holotype) **E–H** *T. multiangulata* sp. n. (holotype)

***Tetraserica multiangulata* sp. n.**

<http://zoobank.org/39A606B9-CB46-4D7B-BED6-CCBCA31DBC11>

Figures 22, 49

**Type material examined.** Holotype: ♂ “N. Vietnam: 40 km NE Thainguyen, 300 m, 14.V.1963, leg. O. Kabakov” (ZIN).

**Description.** Length of body: 7.6 mm; length of elytra: 6 mm; maximum width: 4.5 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.53. Ratio of length of metepisternum/metacoxa: 1/1.5. Posterior margin of metafemur with blunt tooth. Metatibia moderately long and wide, ratio width/length: 1/3.31; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 22E–G. Habitus: Fig. 22H.

Female unknown.

**Diagnosis.** *Tetraserica multiangulata* sp. n. differs by all other *Tetraserica* species by the blunt tooth at the posterior margin of metafemur, by the long and narrow left paramere, by the median lamina of phallobase being as long or nearly as long as phallobase, and by the left paramere being more than half as long as phallobase; furthermore, the left paramere is split shortly before the apex into two filiform but flattened branches.

**Etymology.** The name of the new species (adjective in the nominative singular) is derived from the combined Latin words *multi* (numerous) and *angulatus* (angled), with reference to the parameres being bent numerous times.

#### *Tetraserica tanahrataensis* sp. n.

<http://zoobank.org/C8530975-DCD8-41D8-AE52-845DBBDF0990>

Figures 23, 51

**Type material examined.** Holotype: ♂ “Malaysia-W, Pahang, 30 km E of IPOH, 1500 m Camerons Highlands, TANAHRATA, 7-9.i.1999, P. Čechovský leg./ 928 Sericini Asia spec.” (ZFMK). Paratype: 1 ♂ “X-DA0347 labcode: VD1, Malaysia-W, Kelantan Road between Kampong Raja and Gua Musang, 04°63'N, 101°, 45'E/ 04°88'N, 101°95'E, 1-28.iv.2006, P. Čechovský leg. *Tetraserica* sp?1/ X-DA0347/ sp-MA1” (ZFMK), 1 ♂ “X-DA3135 Malaysia: Pahang, Tanah Rata (at light), 4°28'20"N, 101°22'42"E, 8.iii.2010, leg. P. Sipek H. Sipkova” (ZFMK), 1 ♂ “Malaysia, Pahang Cameron Highlands, 2 km S Tanah Rata on Tapah road,/ montane rainforest at light No 93 29.III.1995 O. Merkl & I. Szikossy” (HNHM).

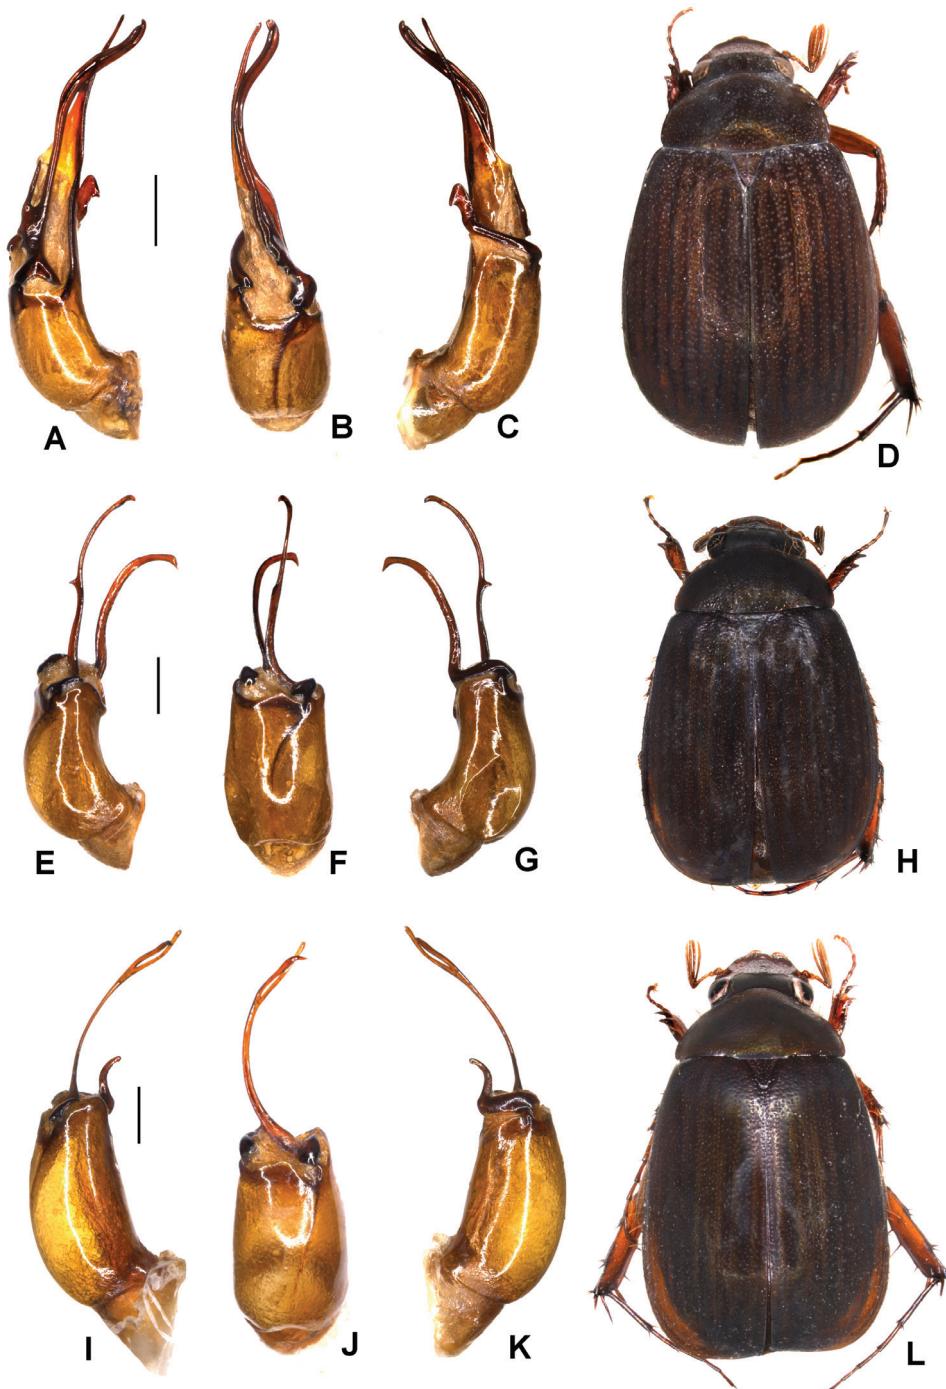

**Description.** Length of body: 9.6 mm; length of elytra: 7.4 mm; maximum width: 6.1 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.53. Ratio of length of metepisternum/metacoxa: 1/1.48. Metatibia short and wide, ratio width/length: 1/3.25; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 23A–C. Habitus: Fig. 23D.

Female unknown.

**Variation.** Length of body: 9.6–9.9 mm; length of elytra: 7.4–7.5 mm; maximum width: 6.0–6.1 mm.

**Diagnosis.** *Tetraserica tanahrataensis* sp. n. is rather similar to *T. mengeana* Liu et al., 2014 in the general shape of the aedeagus; the new species differs by lacking trichome-like spines at the base of the right paramere, and the less strongly curved left paramere, which is nearly straight in the basal two thirds.

**Figure 23.** **A–D** *Tetraserica tanahrataensis* sp. n. (holotype) **E–H** *T. microspinosa* sp. n. (holotype) **I–L** *T. microfurcata* sp. n. (holotype) **A, E, I** aedeagus, left side lateral view **C, G, K** aedeagus, right side lateral view **B, F, J** parameres, dorsal view **D, H, L** habitus. Scale bars: 0.5 mm. Habitus not to scale.

**Etymology.** The new species is named after the type locality, Tanahrata (adjective in the nominative singular).

***Tetraserica microspinosa* sp. n.**

<http://zoobank.org/F762B902-3FCE-4090-BAFE-96FBF7027015>

Figures 23, 50

**Type material examined.** Holotype: ♂ “N Vietnam - Lao Cai province, Van Ban district: Van Ban Nature Reserve- (~1000 m)- 23-26.V.2011/ L. Bartolozzi, S. Bambi, F. Fabiano, E. Orbach leg./ 934 Sericini Asia spec.” (VNMN).

**Description.** Length of body: 7.5 mm; length of elytra: 5.8 mm; maximum width: 5 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.46. Ratio of length of metepisternum/metacoxa: 1/1.61. Metatibia moderately long and wide, ratio width/length: 1/3.58; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 23E–G. Habitus: Fig. 23H.

Female unknown.

**Diagnosis.** *Tetraserica microspinosa* sp. n. differs from all *Tetraserica* species in having a very short median phallobasal lamina and by having both parameres long and filiform.

**Etymology.** The name of the new species (adjective in nominative singular) is derived from the combined Greek and Latin words *micros* (small) and *spinosus* (with spines), with reference to a small spine-like tooth on the left paramere.

***Tetraserica microfurcata* sp. n.**

<http://zoobank.org/E448A3AD-3288-4365-A4C0-1E951690C9E4>

Figures 23, 49

**Type material examined.** Holotype: ♂ “Laos, 1-16.V.1999, Louangpharabang pr., 23°33'–4'N, E102°14'E, Ban Song Cha (5km W), 1200 m, Vít Kubáň leg./ coll. P. Pačholátko” (CPPB). Paratypes: 1 ♂ “Vietnam: Cuc phong, Ninh binh, 3-10.V.1966 Exp. Gy. Topál / Nr. 268 beaten from bushes near creek” (ZFMK), 1 ♀ “Vietnam: Cuc phong, Ninh binh, 3-10.V.1966 Exp. Gy. Topál / Nr. 252 singled material” (HNHM), 1 ♂ “Vietnam: Cuc phong, Ninh binh, 6-18.V.1966 Topál/ Nr. 387 from trap in soil” (HNHM).

**Description.** Length of body: 8.6 mm; length of elytra: 6.5 mm; maximum width: 5.3 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.57. Ratio of length of metepisternum/metacoxa: 1/1.38. Metatibia moderately long and wide, ratio width/length: 1/3.43; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 23I–K. Habitus: Fig. 23L.

Female unknown.

**Variation.** Length of body: 7.6–8.6 mm; length of elytra: 5.5–6.5 mm; maximum width: 4.5–5.3 mm.

**Diagnosis.** *Tetraserica microfurcata* sp. n. differs from the similar *T. microspinosa* sp. n. by the weakly curved, long and filiform left paramere, which is split in apical quarter into two fine branches, as well as the short and slim right paramere being strongly bent at middle.

**Etymology.** The name of the new species (adjective in nominative singular) is derived from the combined Greek and Latin words *micros* (small) and *furcatus* (forked), with reference to the superficial split of the left paramere into two filiform branches.

### ***Tetraserica takahashii* Kobayashi, 2017**

Figures 24, 54

*Tetraserica takahashii* Kobayashi, 2017: 36, figs 3, 12.

**Material examined.** 1 ♂ “X-DA4503 labcode: VD025/ Vietnam, Quang Binh prov. 1 km N of Cha Lo, 400 m Vietnam-Laos border area 17°41'22"N, 105°45'45"E, 11.-24. iv.2010 L. Dembický leg. (VN1/ 2010 MZM EXPEDITION) *Tetraserica* spVI\_V3/ X-DA4503/ sp-VI-V2” (ZFMK), 1 ♂ “X-DA4502 labcode: VD024/ Vietnam, Quang Binh prov. 1km N of Cha Lo, 400 m Vietnam-Laos border area 17°41'22"N, 105°45'45"E, 11-24.iv.2010 L. Dembický leg. (VN1/ 2010 MZM EXPEDITION) *Tetraserica* spVI\_V3/ X-DA4502” (ZFMK), 3 ♂♂ “Vietnam, Quang Binh prov. 1 km N of Cha Lo, 400 m Vietnam-Laos border area 17°41'22"N, 105°45'45"E, L Dembický leg. 11-24.iv.2010” (ZFMK).

**Description.** Length of body: 9 mm; length of elytra: 6.8 mm; maximum width: 6.3 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.58. Ratio of length of metepisternum/metacoxa: 1/1.55. Metatibia short and wide, ratio width/length: 1/3.17; basal group of dorsal spines of metatibia at first third of metatibial length.

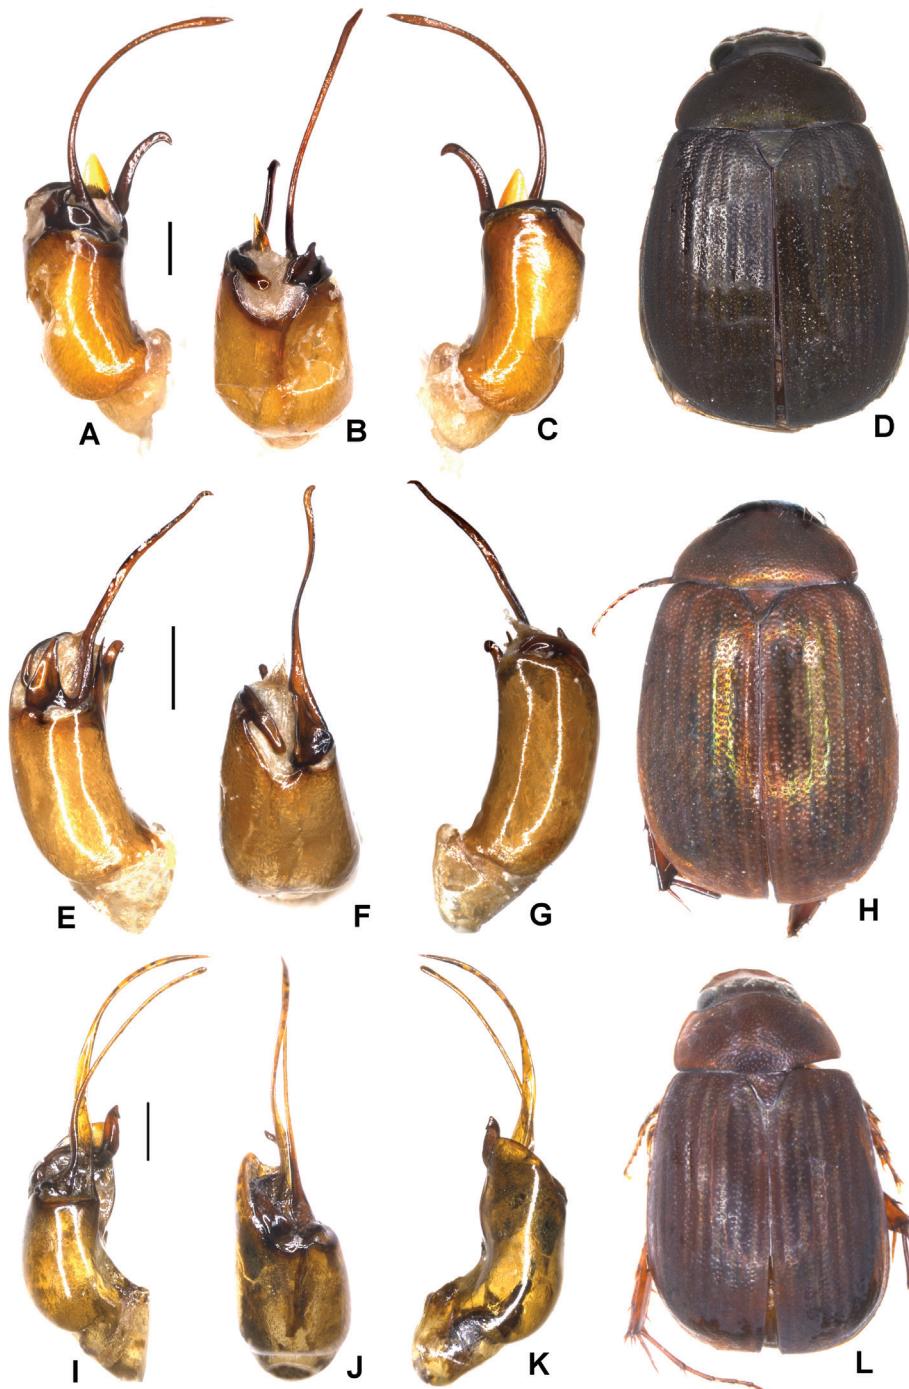

Aedeagus: Fig. 24A–C. Habitus: Fig. 24D.

### ***Tetraserica ululalatensis* sp. n.**

<http://zoobank.org/4FFC6D8B-5555-47A8-8EF6-D30F8C0F9477>

Figures 24, 51

**Type material examined.** Holotype: ♂ “Malaysia W, Kelantan 30 km NW of Gua Musang Ulu Lalat Mt. 800–1000 m Kampong Sungai om 27.v.-19.vi.2011 Petr Cechovsky lgt.” (ZFMK).

**Figure 24.** **A–D** *Tetraserica takahashii* Kobayashi, 2017 (Vietnam: Cha Lo) **E–H** *T. ululalatensis* (holotype) **I–L** *T. infida* sp. n. (holotype) **A, E, I** aedeagus, left side lateral view **C, G, K** aedeagus, right side lateral view **B, F, J** parameres, dorsal view **D, H, L** habitus. Scale bars: 0.5 mm. Habitus not to scale.

**Description.** Length of body: 7.6 mm; length of elytra: 6.0 mm; maximum width: 4.7 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes large, ratio of diameter/interocular width: 0.72. Ratio of length of metepisternum/metacoxa: 1/1.62. Metatibia moderately long and wide, ratio width/length: 1/3.1; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 24E–G. Habitus: Fig. 24H.

Female unknown.

**Diagnosis.** *Tetraserica ululalatensis* sp. n. differs from similar *T. fikaceki* Liu et al., 2014 by the dorsal lobe of right paramere being directed basally, and the ventral lobe of left paramere being extremely long rather than short.

**Etymology.** The new species is named after the type locality, Ulu Lalat Mt (adjective in the nominative singular).

***Tetraserica infida* sp. n.**

<http://zoobank.org/1657B2A3-FC91-4577-BC86-314FF439CF24>

Figures 24, 47

**Type material examined.** Holotype: ♂ “Birmania Ruby M/ Doherty” (NHMUK). Paratype: 1 ♀ “Birmania Ruby M<sup>es</sup>/ Doherty/ Fry Coll. 1900.100.” (NHMUK).

**Description.** Length of body: 7.3 mm; length of elytra: 5.4 mm; maximum width: 4.6 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.56. Ratio of length of metepisternum/metacoxa: 1/1.52. Metatibia short and wide, ratio width/length: 1/2.85; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 24I–K. Habitus: Fig. 24L.

**Variation.** Length of body: 7.3–8.1 mm; length of elytra: 5.4–6.6 mm; maximum width: 4.6–5.0 mm. Female: Antennal club with three antennomeres, as long as remaining antennomeres combined; eyes as large as in male.

**Diagnosis.** *Tetraserica infida* sp. n. strongly resembles *T. maerimensis* Kobayashi, 2018; the new species differs from the latter by the simple left paramere not being divided into dorsal and ventral lobes.

**Etymology.** The name of the new species (adjective in nominative singular) is derived from the combined Latin prefix *in-* (non-) and adjective *fidus* (split), with reference to its unsplit left paramere.

***Tetraserica bansanpakiana* sp. n.**

<http://zoobank.org/2BA8B100-260C-4481-A964-9298E108A3CA>

**Description.** Length of body: 6.9 mm; length of elytra: 4.6 mm; maximum width: 4.1 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.41. Ratio of length of metepisternum/metacoxa: 1/1.6. Metatibia short and wide, ratio width/length: 1/3.2; basal group of dorsal spines of metatibia at first third of metatibial length. Robust spine at middle of ventral margin extremely prolonged and s-shaped, exceeding distal margin of metatibia.

Aedeagus: Fig. 25A–C. Habitus: Fig. 25D.

**Variation.** Length of body: 6.9–8.5 mm; length of elytra: 4.6–5.9 mm; maximum width: 4.1–5.1 mm. Colour may vary from dark brown to nearly entirely yellowish brown with dark head. Female: Antennal club with three antennomeres, as long as remaining antennomeres combined; eyes as large as in male; pygidium flat; robust spines on ventral margin of metatibia subequal in length.

**Diagnosis.** The new species differs from all other *Tetraserica* species by the robust metatibial spine in middle of ventral margin being extremely elongate and s-shaped, exceeding distal margin of metatibia.

**Etymology.** The new species is named after the type locality, Ban San Pakia (adjective in the nominative singular).

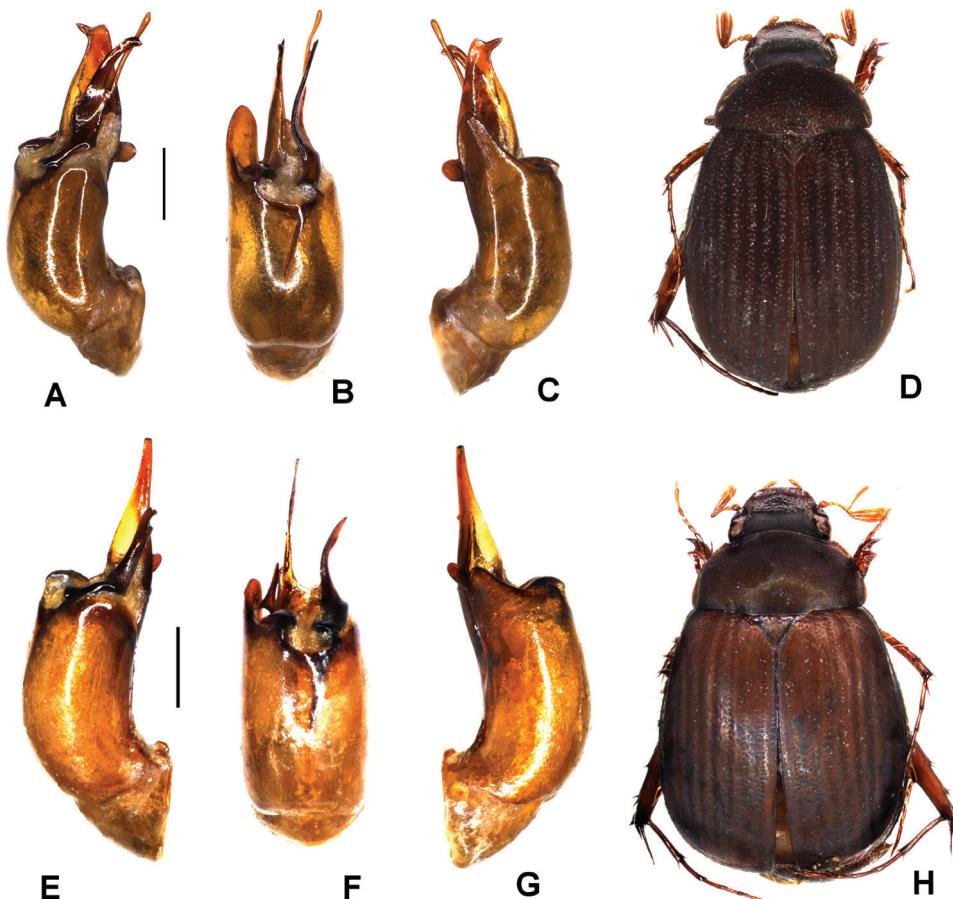

### *Tetraserica margheritae* sp. n.

<http://zoobank.org/7DE10DB1-020C-48F0-80C1-0C0B9757430A>

Figures 25, 51

**Type material examined.** Holotype: ♂ “Thailand bor. Chiang Mai, 56 km NW 99°25'N, 19°05'E, 7-14.6.1995 lgt. Snizek M./ 943 Sercini Asia spec.” (ZFMK). Paratype: 1 ♂ “Thailand bor. Chiang Mai, 56km NW 99°25'N, 19°05'E, 7-14.6.1995 lgt. Snizek M./ 943 Sercini Asia spec.” (ZFMK).

**Description.** Length of body: 7.3 mm; length of elytra: 6.1 mm; maximum width: 4.6 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to

**Figure 25.** **A–D** *Tetraserica bansanpakiana* sp. n. (holotype) **E–H** *T. margheritae* sp. n. (holotype)  
**A, E** aedeagus, left side lateral view **C, G** aedeagus, right side lateral view **B, F** parameres, dorsal view  
**D, H** habitus. Scale bars: 0.5 mm. Habitus not to scale.

eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.44. Ratio of length of metepisternum/metacoxa: 1/1.62. Metatibia short and wide, ratio width/length: 1/2.83; basal group of dorsal spines of metatibia at first third of metatibial length. Robust spine at middle of ventral margin extremely prolonged and s-shaped, exceeding distal margin of metatibia.

Aedeagus: Fig. 25E–G. Habitus: Fig. 25H.

Female unknown.

**Variation.** Length of body: 7.1–7.3 mm; length of elytra: 4.8–6.1 mm; maximum width: 4.5–4.6 mm.

**Diagnosis.** *Tetraserica margheritae* sp. n. differs from the externally similar *T. bansanpakiana* sp. n. by the median phallobasal lamina being narrower and sharply pointed at apex, also by having a dorsal tooth and the left paramere being distinctly shorter than median phallobasal lamina.

**Etymology.** The new species is named after Silvia's mother, Margherita (noun in genitive singular).

### *Tetraserica soppongana* sp. n.

<http://zoobank.org/17358D8D-981B-4CB4-863B-E15CF4F97588>

Figures 26, 53

**Type material examined.** Holotype: ♂ “THAI 1-8.V.1993 SOPPONG PAI 1800 m Pacholátko & Dembický leg./ Coll. P. Pacholátko/ 160 Sericini Asia spec.” (CPPB). Paratype: 1 ♂ “THAI 28-31/5.1995 19.27N 98.20E SOPPONG 1500m Vít Kubáň leg./ Coll. P. Pacholátko/ TS49/ 472 Sericini Asia spec.” (ZFMK).

**Description.** Length of body: 6.9 mm; length of elytra: 5 mm; maximum width: 4 mm. Body yellowish brown, head dark, antenna yellow. Surface of labroclypeus and

**Figure 26.** **A–D** *Tetraserica maerimensis* Kobayashi, 2018 (Thailand, Doi Inthanon) **E–I** *T. soppongana* sp. n. (holotype) **J–M** *T. longipenis* Liu et al., 2014 (holotype) **A, E, J** aedeagus, left side lateral view **C, H, L** aedeagus, right side lateral view **B, F, K** parameres, dorsal view **G** parameres, ventral view **D, I, M** habitus. Scale bars: 0.5 mm. Habitus not to scale.

disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.71. Ratio of length of metepisternum/metacoxa: 1/1.55. Metatibia moderately long and wide, ratio width/length: 1/3.4; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 26E–H. Habitus: Fig. 26I.

Female unknown.

**Variation.** No significant size variation between types.

**Diagnosis.** *Tetraserica soppongana* sp. n. differs from all other *Tetraserica* species in having a long median phallobasal lamina, the right paramere composed of two lobes and having no brush of spines at the base of the right paramere, by the left paramere being composed of two lobes, the right side of phallobase strongly produced, and the dorsal lobe of left paramere as long as ventral one.

**Etymology.** The new species is named after the type locality, Soppong (adjective in the nominative singular).

### *Tetraserica longipenis* Liu, Fabrizi, Bai, Yang & Ahrens, 2014

*Tetraserica longipenis* Liu, Fabrizi, Bai, Yang & Ahrens, 2014: 98, fig. 4I–L.

**Material examined. Vietnam:** 1 ♂ “N-VIETNAM Cao Bang Prov., vic. Vin Den, Nui Pia Oac Nat. Res.06.-10.V.2013, 22°33'53"N, 105°52'53"E, 900–1300 m A. Skale” (ZFMK). **Thailand:** 1 ♂ “Mt. Doi Ku Sath-an, Na Noi Nan. N. Thailand 16/V/93 S. Ohmomo leg./ coll. D. Ahrens” (ZFMK). **Laos:** 1 ♂ “LAOS north, 24-30.V.1997, 20 km NW Louang Namtha, N 21°09.2, E 101°18.7, alt. 900±100 m, E. Jendek & O. Šauša leg./ (Coll. P. Pacholátko)” (CPPB), 1 ♂ “LAOS, N 21°09.2, 101°19 E, Louangnamtha pr., Namtha-Muang Sing, 5-31.v.1997, 900–1200 m Vít Kubáň leg./ Coll. P. Pacholátko” (CPPB), 1 ♂ “X-DA4512 labcode: VD032 LAOS Hua Phan prov.; Ban Saleui, Phou Pan (Mt) 20°12'N, 104°01'E, 3-5.iv.2013 leg., C. Holzschuh Tetraserica spLA\_V5/ X-DA4512” (ZFMK).

Aedeagus: Fig. 26J–L. Habitus: Fig. 26M.

**Remarks.** This species was known from southern China and Thailand (Kobayashi 2017), and it is recorded here from Vietnam and Laos for the first time.

### *Tetraserica angkhangensis* Kobayashi, 2017

Figures 27, 47

*Tetraserica angkhangensis* Kobayashi, 2017: 42, figs 9, 18.

**Material examined. Myanmar:** 1 ♂ “Burma (Myanmar) SW: Shan state Taunggyi J. Rejsek 1-18.6.1997/ coll. D Ahrens/ Sericini Asia spec. 214” (ZFMK), 8 ♂♂

“Burma (Myanmar) SW: Shan state Taunggyi J. Rejsek 1-18.6.1997/ coll. D Ahrens” (ZFMK), 4 ♂♂, 2 ♀♀ “Burma (Myanmar) SW: Shan state Taunggyi J. Reysek [sic!] 1-18.6.1997/ coll. D Ahrens” (ZFMK).

Aedeagus: Fig. 27A–C. Habitus: Fig. 27D.

**Remarks.** This species was described from Thailand, and is recorded from Myanmar for the first time.

***Tetraserica giulianae* sp. n.**

<http://zoobank.org/A8E0B987-9B05-4DA9-9AC8-9FF05EAE1E91>

Figures 27, 56

**Type material examined.** Holotype: ♂ “Shan States Mandets/ 1001 Asia Sericini spec.” (MNHN).

**Description.** Length of body: 7.8 mm; length of elytra: 5.9 mm; maximum width: 4.8 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.56. Ratio of length of metepisternum/metacoxa: 1/1.64. Metatibia short and wide, ratio width/length: 1/3.08; basal group of dorsal spines of metatibia at first third of metatibial length. Ventral distal spine of metatibia inserted shortly behind middle of ventral margin of metatibia and longer than the long metatarsomere 1.

Aedeagus: Fig. 27E–G. Habitus: Fig. 27H.

Female unknown.

**Diagnosis.** *Tetraserica giulianae* sp. n. is similar to *T. angkhangensis* Kobayashi, 2017 in shape of the aedeagus, but the new species differs by the basal lobe of left paramere being as long as the ventral lobe, rather than half its length.

**Etymology.** The new species is named in honour of our friend Giuliana Caturegli (Rome) (noun in genitive singular).

***Tetraserica yaoquensis* Liu, Fabrizi, Bai, Yang & Ahrens, 2014**

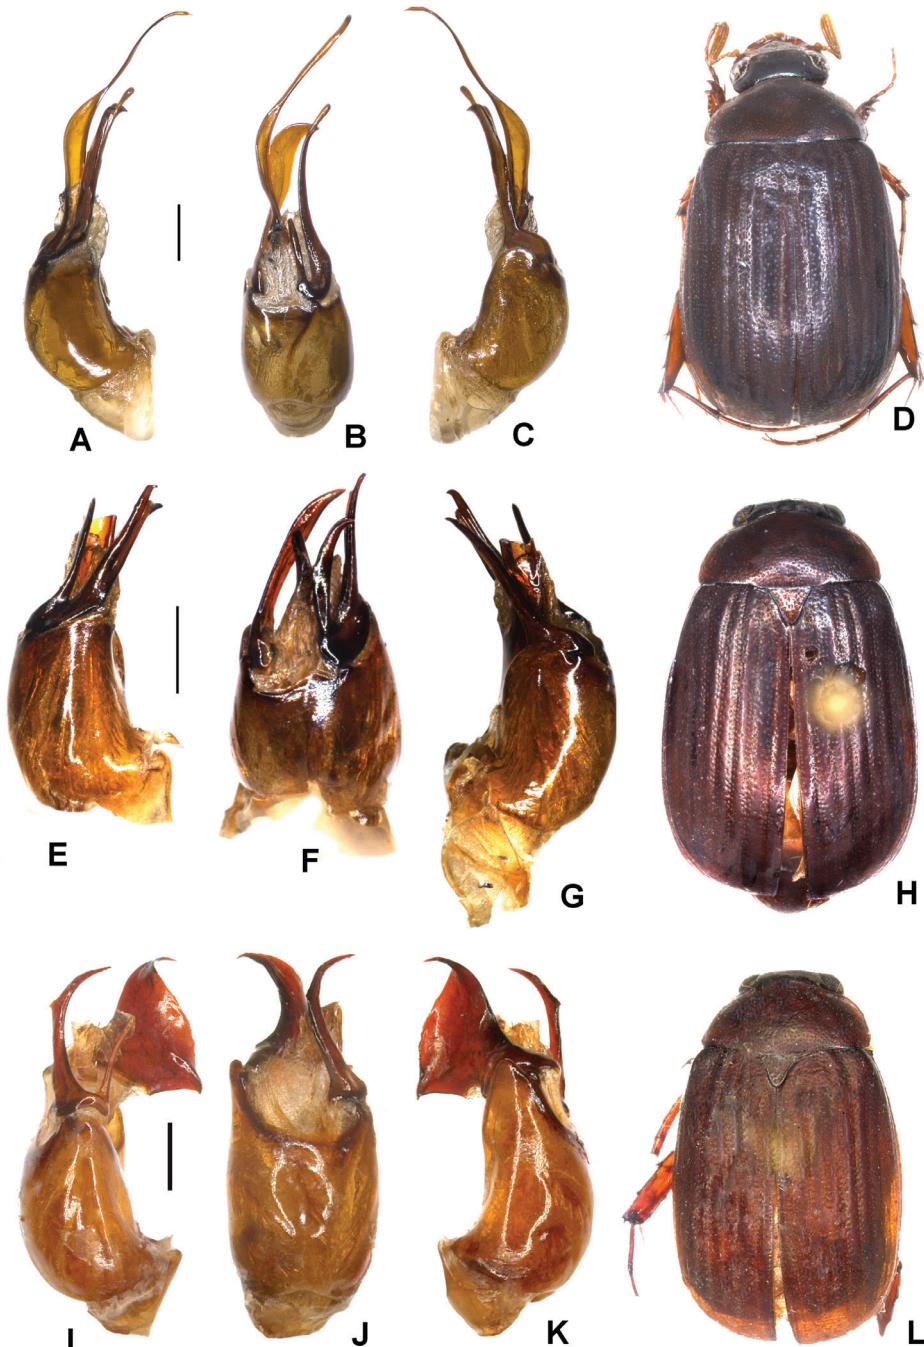

Figures 27, 55

behind checkpoint 691 m Malaise trap, 17°27.829'N, 101°21.360'E, 5–8.vi.2007, Patikhom Tumtop leg. T2514, *Tetraserica* sp TH\_V66/ X-DA4647" (QSBG).

**Description.** Length of body: 7.5 mm; length of elytra: 5.6 mm; maximum width: 5 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.56. Ratio of length of metepisternum/metacoxa: 1/1.8. Metatibia moderately long and wide, ratio width/length: 1/3.91; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 28E–H. Habitus: Fig. 28I.

Female unknown.

**Variation.** Length of body: 7.5–7.7 mm; length of elytra: 5.5–5.6 mm; maximum width: 4.7–5.0 mm.

**Diagnosis.** *Tetraserica loeiensis* sp. n. is rather similar to *T. matsumotoi* Kobayashi, 2017 and *T. wapiensis* (Frey, 1972) in shape of the aedeagus; the new species differs from both by the dorsal lobe of left paramere which is distinctly longer than the ventral one.

**Etymology.** The new species is named with reference to its occurrence in Loei province (adjective in the nominative singular).

***Tetraserica subrotundata* sp. n.**

<http://zoobank.org/E13B4C20-331D-4A7E-8652-9A8FA6B817E7>

Figures 29, 53

**Type material examined.** Holotype: ♂ “Coll. I. R. Sc. N. B. Cambodia (Pursat Prov.) Phnom Samkos wild life Sanctuary, light trap Forest Edge & Primary 14-IV-2005 Leg. K Smets & I Var/ 903 Sericini Asia spec. “ (ISNB). Paratypes: 1 ♂ “Coll. I. R. Sc. N. B. Cambodia, Pursat Prov. Phnom Samkos W.S. Pramaoy, forest edge, 13-IV-2005, Light Trap Leg. K Smets & I Var/ Sericini Asia spec. 905” (ZFMK), 1 ♂ “Coll. I. R. Sc. N. B. Cambodia, Pursat Prov. Phnom Samkos W.S. Pramaoy, forest edge, 13-IV-2005, Light Trap Leg. K Smets & I Var” (ISNB).

**Description.** Length of body: 7.1 mm; length of elytra: 5.5 mm; maximum width: 4.8 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.57. Ratio of length of metepisternum/metacoxa: 1/1.83. Metatibia short and wide, ratio width/length: 1/3.15; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 29A–C. Habitus: Fig. 29D.

Female unknown.

**Variation.** Length of body: 7.1–8.1 mm; length of elytra: 5.5–5.8 mm; maximum width: 4.7–4.8 mm.

**Diagnosis.** *Tetraserica subrotundata* sp. n. is rather similar to *T. matsumotoi* Kobayashi, 2017 in shape of the aedeagus; the new species differs by the right paramere being bent only once and being slightly wider in lateral view, and the apex of median phallobasal lamina strongly rounded instead of sharply pointed.

**Etymology.** The name of the new species (adjective in nominative singular) is derived from the combined Latin prefix *sub-* (under) and adjective *rotundatus* (rounded), with reference to the shape of the medial apical phallobasal lamina of the aedeagus.

**Description.** Length of body: 7.9 mm; length of elytra: 5.6 mm; maximum width: 5.6 mm. Surface of labroctypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.41. Ratio of length of metepisternum/metacoxa: 1/1.79. Metatibia short and wide, ratio width/length: 1/3.08; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 30A–C. Habitus: Fig. 30D.

Female unknown.

**Diagnosis.** *Tetraserica angkorthomensis* sp. n. differs from the very similar *T. kiriromensis* sp. n. by the distinctly shorter right paramere and wider and longer dorsal lobe of left paramere which is directed more distally rather mesally.

**Etymology.** The new species is named after the type locality, Angkor Thom (adjective in the nominative singular).

**Figure 30. A–D** *Tetraserica angkorthomensis* sp. n. (holotype) **A** aedeagus, left side lateral view **C** aedeagus, right side lateral view **B** parameres, dorsal view **D** habitus. Scale bars: 0.5 mm. Habitus not to scale.

***Tetraserica pailinensis* sp. n.**

<http://zoobank.org/D7456CED-5A84-426D-ABF8-0F2FE6E4879B>

Figures 31, 50

**Type material examined.** Holotype: ♂ “X-DA4506 labcode: VD028 Cambodia Pailin 200 m, 11-16.v.2009, S. Murzin leg. *Tetraserica* spCA\_V4/ X-DA4506/ sp-CA-V4” (ZFMK). Paratype: 1 ♂ “835104/ 835104 Cambodia Pailin 270 m 6-16.v.2008 S. Murzin leg. *Tetraserica* sp CA2sp1” (ZFMK).

**Description.** Length of body: 8.5 mm; length of elytra: 6.5 mm; maximum width: 5 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.5. Ratio of length of metepisternum/metacoxa: 1/1.88. Metatibia moderately long and wide, ratio width/length: 1/3.46; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 31A–C. Habitus: Fig. 31D.

Female unknown.

**Variation.** Length of body: 8.0–8.5 mm; length of elytra: 5.9–6.5 mm; maximum width: 5.0–5.4 mm.

**Diagnosis.** *Tetraserica pailinensis* sp. n. is similar to *T. loeiensis* sp. n. in shape of aedeagus; *T. pailinensis* sp. n. differs from the latter by the dorsal lobe of the left paramere being twice as long as the ventral one.

**Etymology.** The new species is named after the type locality, Pailin (adjective in the nominative singular).

***Tetraserica banhuaipoensis* sp. n.**

<http://zoobank.org/8A9F9D74-65E9-4518-B507-321C68725FFB>

Figures 31, 47

**Type material examined.** Holotype: ♂ “NW Thailand, 9.-16.V. MAE HONG SON 1991 Ban Huai Po 1600 m leg. P. Pacholátko/ coll. P. Pacholátko/ 151 Sericini Asia spec.” (CPPB). Paratypes: 1 ♂ “NW Thailand, 9.-16.V. MAE HONG SON 1991 Ban Huai Po 1600 m leg. P. Pacholátko/ coll. P. Pacholátko” (ZFMK), 1 ♂ “THAI: 29.IV.1993, PAI City; Pacholatko & Dembicky leg./ coll. Pacholátko/ 155 Sericini Asia spec.” (ZFMK), 1 ♂ “THAI: 29.IV.1993, PAI City; Pacholatko & Dembicky leg./ coll. Pacholátko” (CPPB).

**Description.** Length of body: 8.5 mm; length of elytra: 6.4 mm; maximum width: 5.6 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.56. Ratio of length of metepisternum/metacoxa: 1/1.71. Metatibia short and wide, ratio width/length: 1/3.07; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 31E–G. Habitus: Fig. 31H.

Female unknown.

**Variation.** Length of body: 6.0–8.5 mm; length of elytra: 4.7–6.4 mm; maximum width: 4.2–5.6 mm.

**Diagnosis.** *Tetraserica banhuaipoensis* sp. n. is similar to *T. matsumotoi* Kobayashi, 2017 and *T. kiriromensis* sp. n. in shape of the aedeagus. *T. banhuaipoensis* sp. n. differs from *T. matsumotoi* by having the right paramere distinctly shorter than median lamina of phallobase; from *T. kiriromensis* it differs by the sharply pointed apex of median phallobasal lamina and the right paramere being bent twice.

**Etymology.** The new species is named after the type locality, Ban Huai Po (adjective in the nominative singular).

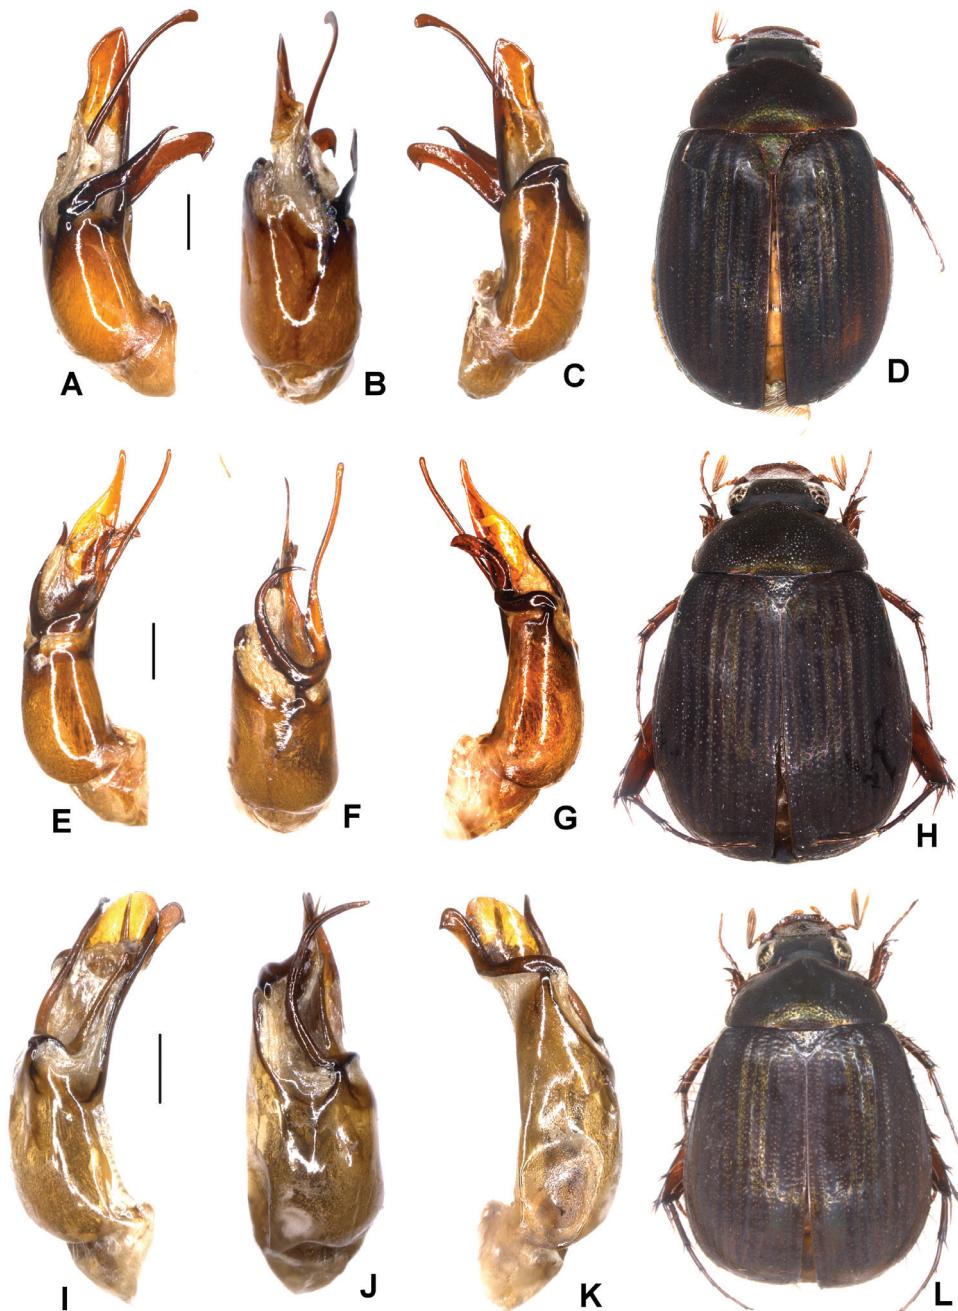

***Tetraserica nussi* sp. n.**

<http://zoobank.org/578BA569-0089-47AE-BE8D-04DE7D42BC67>

Figures 31, 49

**Type material examined.** Holotype: ♂ “Cambodia 3. Cardamom Mts., near Cham Kar Chhrey, 12°20'N, 103°01'E, 350 m, Dry Riverine in evergreen forest, 6.iii.2000, leg. M. Nuss/ Staatl. Museum für Tierkunde Dresden/ 119 Sericini Asia spec.” (SMTD). Paratypes: 1 ♂ “Coll. I. R. Sc. N. B. Cambodia, Pursat prov. Phnom Samkos W.S. Pramaoy, forest edge 13-IV-2005, Light Trap Leg. K. Smets & I. Var” (ZFMK), 1 ♂ “Coll. I. R. Sc. N. B. Cambodia, Pursat prov. Phnom Samkos W.S. Pramaoy Forest Edge 15-IV-2005, Light Trap Leg. K. Smets & I. Var” (ISNB), 1 ♂ “Coll. I. R. Sc. N. B. Cambodia, Pursat prov. Phnom Samkos W.S. Pramaoy, forest edge 13.iv. 2005, Light Trap Leg. K. Smets & I. Var” (ISNB).

**Description.** Length of body: 8 mm; length of elytra: 5.8 mm; maximum width: 5.4 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.54. Ratio of length

**Figure 31. A–D** *Tetraserica pailinensis* sp. n. (holotype) **E–H** *T. banhuaipoensis* sp. n. (holotype) **I–L** *T. nussi* sp. n. (holotype) **A, E, I** aedeagus, left side lateral view **C, G, K** aedeagus, right side lateral view **B, F, J** parameres, dorsal view **D, H, L** habitus. Scale bars: 0.5 mm. Habitus not to scale.

of metepisternum/metacoxa: 1/1.68. Metatibia moderately long and wide, ratio width/length: 1/3.38; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 31I–K. Habitus: Fig. 31L.

Female unknown.

**Variation.** Length of body: 8.0–8.1 mm; length of elytra: 5.7–5.8 mm; maximum width: 4.9–5.4 mm.

**Diagnosis.** *Tetraserica nussi* sp. n. is very similar to *T. subrotundata* sp. n. in shape of aedeagus, but differs by the much shorter parameres and median phallobasal lamina; the dorsal lobe of left paramere is as long as the ventral one (and not shorter as in *T. subrotundata*) and the apex of phallobase is strongly asymmetric (dorsal view).

**Etymology.** The new species is named after one of its collectors, M Nuss (noun in genitive singular).

### *Tetraserica khaosoidaoensis* sp. n.

<http://zoobank.org/51AB518E-0306-4DC2-9C8D-3C4CFEBA1B16>

Figures 32, 48

**Type material examined.** Holotype: ♂ “E Thailand, 5.-13.5. Chanthaburi Dist. Khao Soi Dao, 1998, J. Horák leg./ coll. P Pacholátko/ 129 Sericini Asia spec.” (CPPB). Paratype: 1 ♂ “E Thailand, 5.-13.5. Chanthaburi Dist. Khao Soi Dao, 1998, M Knížek lgt./ coll. P Pacholátko” (ZFMK).

**Description.** Length of body: 7.4 mm; length of elytra: 5.6 mm; maximum width: 4.6 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.54. Ratio of length of metepisternum/metacoxa: 1/1.68. Metatibia short and wide, ratio width/length: 1/3; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 32A–C. Habitus: Fig. 32D.

Female unknown.

**Variation.** Length of body: 7.4–7.8 mm; length of elytra: 5.5–5.6 mm; maximum width: 4.6–4.8 mm.

**Diagnosis.** *Tetraserica khaosoidaoensis* sp. n. is very similar to *T. nussi* sp. n. in shape of the aedeagus; but differs by the distinctly shorter right paramere as well as the only slightly bent right paramere.

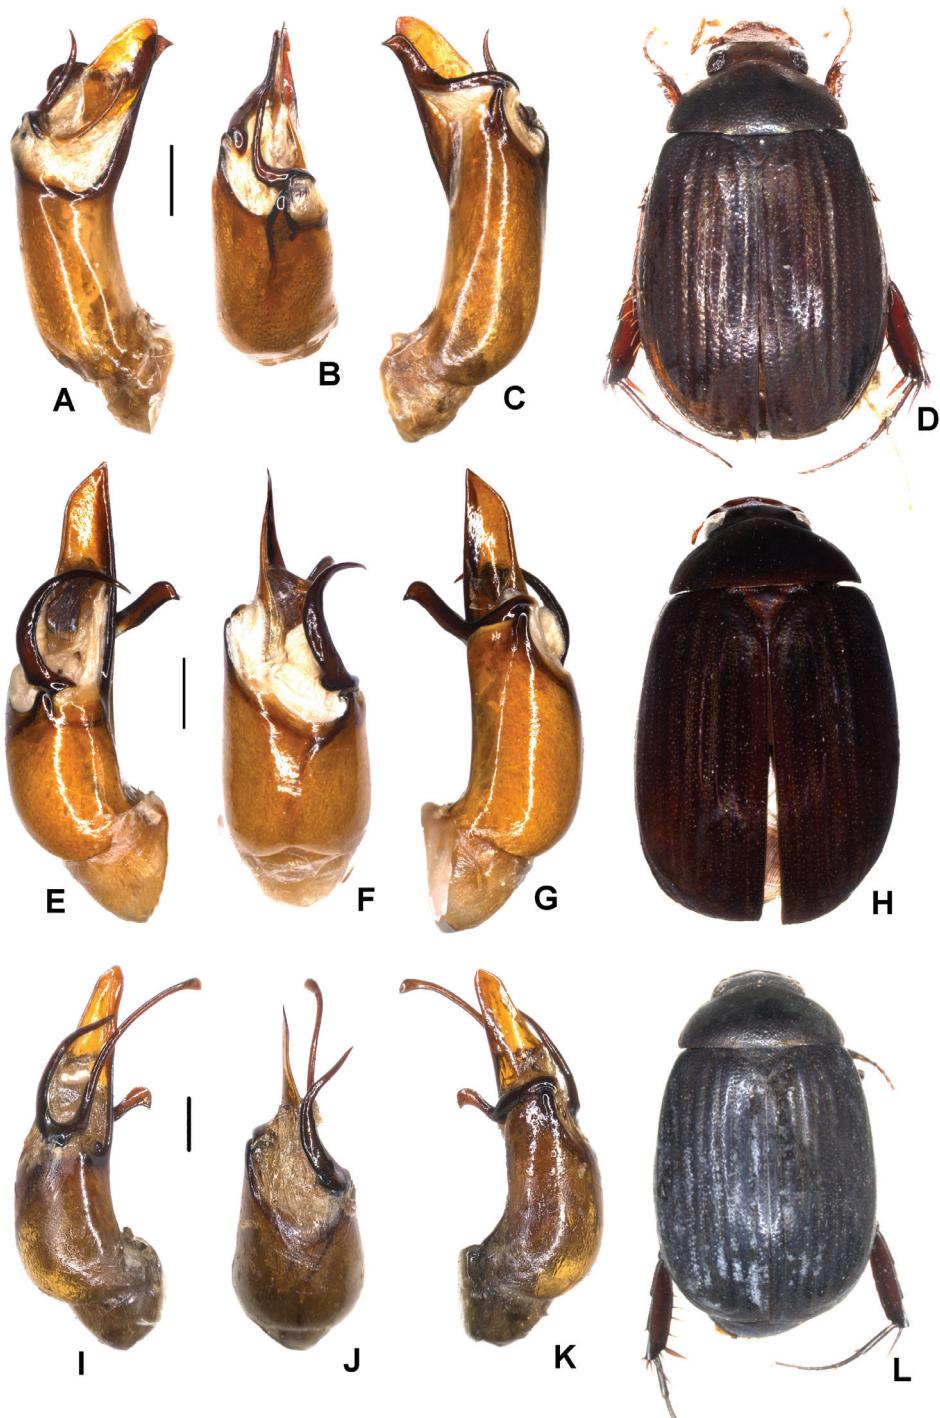

**Etymology.** The new species is named after the type locality, Khao Soi Dao (adjective in the nominative singular).

### *Tetraserica pahinngamensis* sp. n.

<http://zoobank.org/DE3FF861-BE13-4414-94B0-694795D0E5EB>

**Redescription.** Length of body: 7.5 mm; length of elytra: 5.5 mm; maximum width: 4.8 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.45. Ratio of length of metepisternum/metacoxa: 1/1.67. Metatibia moderately long and wide, ratio width/length: 1/3.58; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 32I–K. Habitus: Fig. 32L.

**Remarks.** This species was originally described from Laos, and is now reported from Thailand.

#### *Tetraserica auriculata* sp. n.

<http://zoobank.org/F3EEC3C3-B94A-46DA-A124-D755C513DD6F>

Figures 33, 46

**Type material examined.** Holotype: ♂ "X-DA4700 labcode: VD089 CAMBODIA Sihanouk-ville 20–40 m, 20.-30.iv.2008, S. Murzin leg. *Tetraserica* spCA\_V50/ X-DA4700/ sp-CA-V50" (ZFMK).

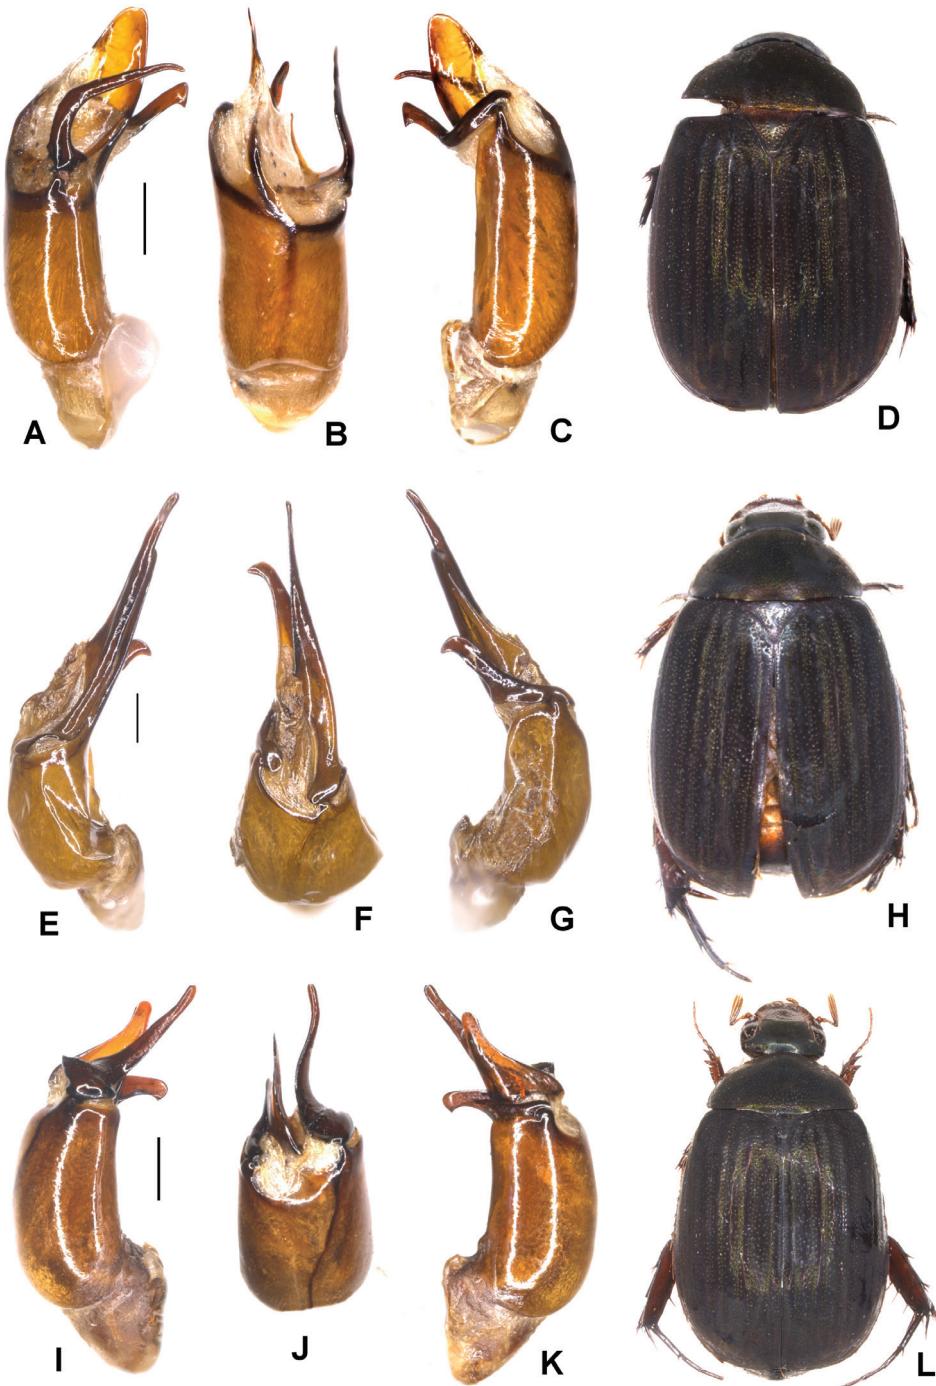

**Description.** Length of body: 8.1 mm; length of elytra: 6.6 mm; maximum width: 5.4 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.5. Ratio of length of metepisternum/metacoxa: 1/1.73. Metatibia short and wide, ratio width/length: 1/3; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 33A–C. Habitus: Fig. 33D.

Female unknown.

**Diagnosis.** *Tetraserica auriculata* sp. n. is similar to *T. pailinensis* sp. n. in shape of aedeagus, from which it differs by the dorsal lobe of the left paramere being distinctly shorter than the median lamina of phallobase and the right paramere being narrower (in lateral view) and distinctly shorter than median lamina of phallobase. In *T. pailinensis* sp. n. the dorsal lobe of left paramere is distinctly exceeding the median lamina of phallobase and the right paramere is wider (in lateral view) and a little shorter than median lamina of phallobase.

**Etymology.** The name of the new species (adjective in nominative singular) is derived from the Latin adjective *auriculatus* (ear-shaped), with reference to the ear-shaped median apical lamella of phallobase.

**Figure 33.** **A–D** *Tetraserica auriculata* sp. n. (holotype) **E–H** *T. semipingjiangensis* sp. n. <http://zoobank.org/630CA170-72D5-434D-A209-61ECA48C954C>

Figures 33, 50

**Type material examined.** Holotype: ♂ “N THAILAND III.1992, 3 km W Ban Rai 170 km NW Bangkok 150 m NN lg. Malicky/ Zoologische Staatssammlung München” (ZSM).

**Description.** Length of body: 9.6 mm; length of elytra: 7.1 mm; maximum width: 6.3 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.5. Ratio of length of metepisternum/metacoxa: 1/1.72. Posterior margin of metafemur with blunt tooth. Metatibia short and wide, ratio width/length: 1/3.13; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 33E–G. Habitus: Fig. 33H.

Female unknown.

**Diagnosis.** *Tetraserica semipingjiangensis* sp. n. differs from *T. pingjiangensis* Liu et al., 2014 by the simple right paramere, which is not split in two lobes.

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Latin words *semi* (half) and the species name *pingjiangensis*, with reference to the similarity to *T. pingjiangensis*.

***Tetraserica laotica* (Frey, 1972), comb. n.**

**Redescription.** Length of body: 9.8 mm; length of elytra: 6.9 mm; maximum width: 5.6 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area ante-

rior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.48. Ratio of length of metepisternum/metacoxa: 1/1.73. Metatibia short and wide, ratio width/length: 1/3.06; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 33I–K. Habitus: Fig. 33L.

**Remarks.** The shape of genitalia of the type specimens of *T. midoriae* Kobayashi, 2017 is virtually identical with that of the holotype of *Tetraserica laotica* (Frey, 1972). Two female paratype specimens (1 ♀ “Laos, V 1967 Ban Van Eua/ Paratype Neoserica laotica G. Frey 1971” (CF), 1 ♀ “Laos: ban Van Heue 20km E of Phou-kow-kuei, 1-15.V.1965/ Paratype Neoserica laotica G. Frey 1971” (CF,) do not belong to this species, as they have both a carinate hypomeron, and are likely to be assigned to the genus *Maladera*.

### *Tetraserica ruiliensis* Liu, Fabrizi, Bai, Yang & Ahrens, 2014

O. Shulga leg.” (ZFMK), 1 ♂ “X-DA4738 LAOS Stupa GH, 5km W Muang Sing,  
750 m, 21.1482N 101.1711E 9.v.-2.vi.2011 M. Murzin, O. Shulga leg.” (ZFMK).

**Description.** Length of body: 10.5 mm; length of elytra: 7.8 mm; maximum width: 6.4 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.51. Ratio of length of metepisternum/metacoxa: 1/1.56. Metatibia short and wide, ratio width/length: 1/2.75; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 34E–G. Habitus: Fig. 34H.

Female unknown.

**Variation.** Length of body: 10.0–10.5 mm; length of elytra: 7.2–7.8 mm; maximum width: 6.1–6.4 mm.

**Diagnosis.** *Tetraserica pseudoruiliensis* sp. n. differs from the similar *T. gestroi* (Brenské, 1898) by the right paramere which is much less than one third as long as left paramere. The new species differs from *T. ruiliensis* Liu et al., 2014 by the left paramere being straight rather than bent at the base.

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Greek prefix *pseudo-* (false) and the species name *ruiliensis*, with reference to the similarity to *T. ruiliensis* Liu et al.

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Latin prefix *semi-* (half) and the species name *ruiliensis*, with reference to the similarity to *T. ruiliensis* Liu et al.

***Tetraserica gestroi* (Brenske, 1898)**

Figures 35, 47

*Neoserica gestroi* Brenske, 1898: 347.

*Tetraserica gestroi*: Ahrens 2004: 168.

**Type material examined.** Lectotype (here designated): ♂ “Teinzo Birmania Fea Maggio 1886/ ♂/ Serica gestroi Type Brsk./ Typus/ Gestroi Brsk./ S. Gestroi Brsk. typus!” (MSNG). Paratypes: 2 ♂♂ “Teinzo Birmania Fea Maggio 1886/ Gestroi Type Brsk./ ♂” (MSNG), 1 ♀ “Teinzo Birmania Fea Maggio 1886/ ♀/ Gestroi Type Brsk./ gestroi Brs.” (ZMHB).

**Redescription.** Length of body: 9.5 mm; length of elytra: 7.1 mm; maximum width: 6.4 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.51. Ratio of length of metepisternum/metacoxa: 1/1.68. Metatibia short and wide, ratio width/length: 1/2.8; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 35E–H. Habitus: Fig. 35I.

Female: Antennal club with three antennomeres, as long as remaining antennomeres combined. Exes smaller than in male, ratio of diameter/interocular width: 0.55. Pygidium flat.

***Tetraserica desalvazzai* sp. n.**

<http://zoobank.org/75EAA1F9-F6D9-443D-BC58-638430A393F9>

Figures 35, 47

**Type material examined.** Holotype: ♂ “Haut Mekong Nam Tha 9.IV.1918. R.V. de Salvazza/ Brit Mus. 1921-89./ 1019 Asia Sericini spec.” (NHMUK). Paratype 1 ♂ “Haut Mekong Weng Vai 23.V.1918, R.V. de Salvazza/ Brit Mus. 1921-89./ 1019 Asia Sericini spec.” (ZFMK).

**Description.** Length of body: 7.6 mm; length of elytra: 6.0 mm; maximum width: 4.7 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes large, ratio of diameter/interocular width: 0.72. Ratio of length of metepisternum/metacoxa: 1/1.62. Metatibia moderately long and wide, ratio width/length: 1/3.1; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 35J–L. Habitus: Fig. 35M.

Female unknown.

**Variation.** Length of body: 7.6–9.1 mm; length of elytra: 6.0–6.5 mm; maximum width: 4.7–5.0 mm.

**Diagnosis.** *Tetraserica desalvazzai* sp. n. is rather similar to *T. gestroi*, from which the new species differs by the left paramere being straight at base, and both parameres being generally more robust.

**Etymology.** The new species is named after the collector, RV de Salvazza (noun in genitive singular).

***Tetraserica phoupaneensis* sp. n.**

<http://zoobank.org/53992DA5-8CA1-4B27-BF5F-329FD5065D14>

Figures 36, 51

**Type material examined.** Holotype: ♂ “LAOS-NE, Houa Phan prov., 20°11–13'N, 103°59'–104°01'E, Ban Saluei -> Phou Pane Mt., 9.-17.vi.2009, 1300–1900 m, Michael Geiser leg./ NHMB Basel, NMPG Prague, Laos 2009, Expedition: M Brancucci, M Geiser, Z Kraus, D Hauck, V Kubáň/ 912 Sericini Asia spec.” (NHMB).

**Description.** Length of body: 8.3 mm; length of elytra: 5.9 mm; maximum width: 4.5 mm. Surface of labroctypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.54. Ratio of length of metepisternum/metacoxa: 1/1.6. Posterior margin of metafemur with blunt tooth. Metatibia moderately long and wide, ratio width/length: 1/3.5; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 36A–C. Habitus: Fig. 36D.

Female unknown.

**Diagnosis.** *Tetraserica phoupaneensis* sp. n. is similar to *T. vietnamensis* (Frey, 1972); the new species differs by the left paramere being as long as phallobase and by the right paramere having a longer basal lobe which is directed distally. In *T. vietnamensis* the left paramere is only half as long as phallobase, and the right paramere has no basal lobe.

**Etymology.** The new species is named after the type locality, Mt Phou Pane (adjective in the nominative singular).

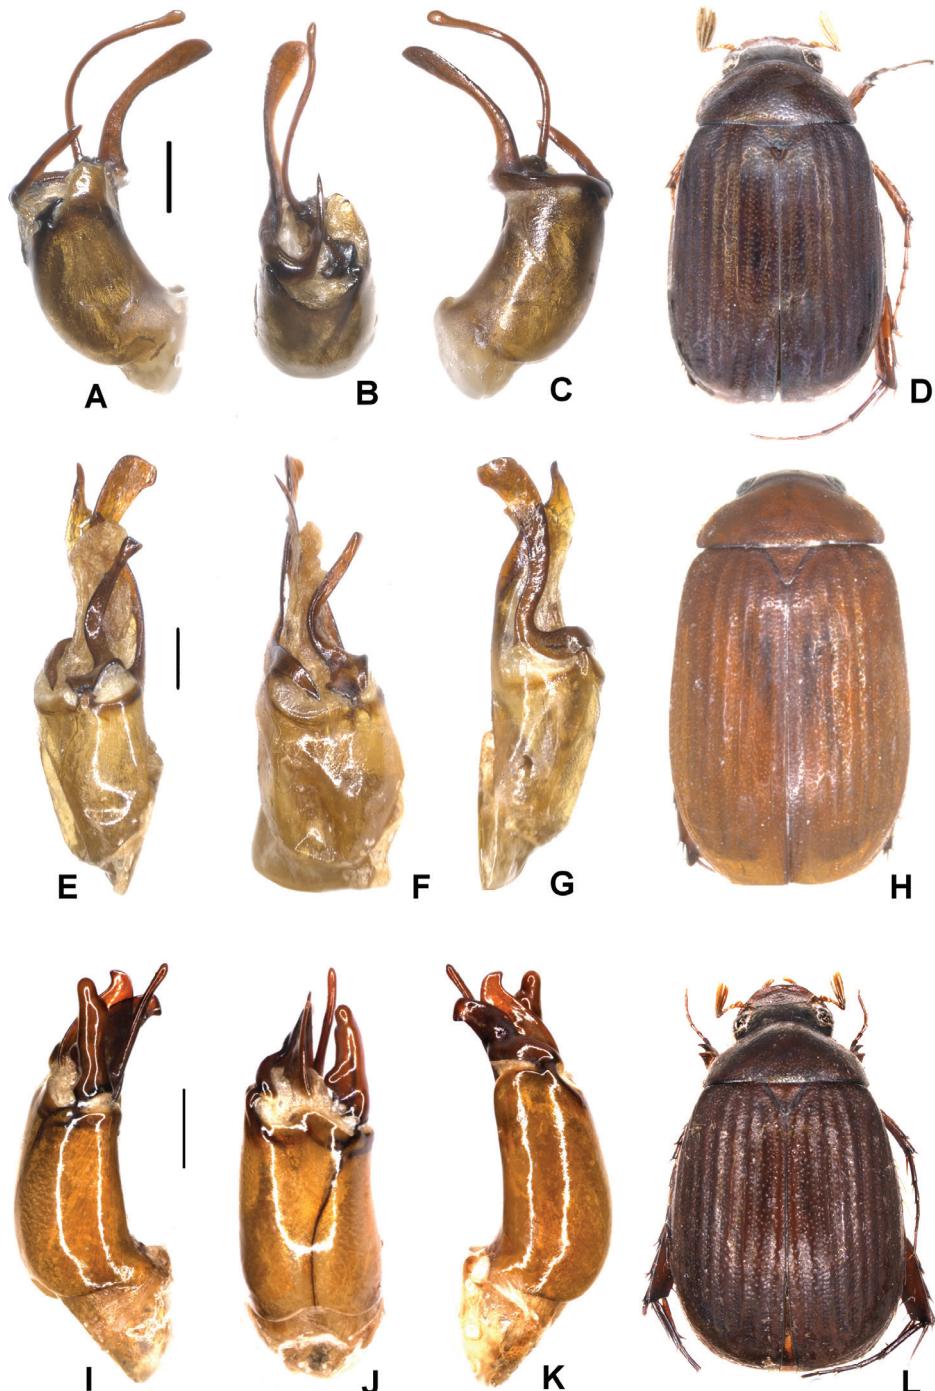

***Tetraserica vietnamensis* (Frey, 1969), comb. n.**

Figures 36, 51

*Neoserica vietnamensis* Frey, 1969: 109, fig. 2b.

N.P.: 6–8 km S of Dam construction-site. 1-10.vi.2007. Leg. C. van Achterberg, R. de Vries & E. Gassó Miracle/ primary evergreen forest near stream; in malaise traps; 750 m, 12°26'26.3"N, 108°19'5"E" (RMNH), 1 ♂ "S Vietnam, 12.03N 108.27E 12 km N of Dalat-Lang Bian, 1580–1750 m, 17-21.iv.1999, Pacholátko & Dembický leg./ coll. P. Pacholátko/ VS 72" (CPPB).

**Redescription.** Length of body: 10.5 mm; length of elytra: 7.9 mm; maximum width: 6.1 mm. Surface of labroctypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.55. Ratio of length of metepisternum/metacoxa: 1/1.69. Posterior margin of metafemur with blunt tooth. Metatibia short and wide, ratio width/length: 1/3.06; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 36E–G. Habitus: Fig. 36H.

***Tetraserica nonglomensis* sp. n.**

<http://zoobank.org/EB86CCFF-D0D4-4483-A1A8-DC5514A06F48>

Figures 36, 51

**Type material examined.** Holotype: ♂ "S LAOS, Attapu, Nong Lom (lake), 18-30. iv.1999 800 m, 15°02N, 106°35'E, E Jendek & O Šauša leg./ Coll. P Pacholátko/ 196 Sericini Asia spec." (CPPB).

**Description.** Length of body: 8 mm; length of elytra: 6.3 mm; maximum width: 5 mm. Surface of labroctypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.56. Ratio of length of metepisternum/metacoxa: 1/1.88. Metatibia short and wide, ratio width/length: 1/2.73; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 36I–K. Habitus: Fig. 36L.

Female unknown.

**Diagnosis.** *Tetraserica nonglomensis* sp. n. is rather similar to *T. breviforceps* sp. n.; *T. nonglomensis* sp. n. differs by the much longer, robust dorsal lobe of left paramere.

**Etymology.** The new species is named after the type locality, Nong Lom Lake (adjective in the nominative singular).

***Tetraserica satula* (Brenske, 1898), comb. n.**

Figures 37, 47

*Neoserica satula* Brenske, 1898: 345.

*Tetraserica graciliforceps* Liu, Fabrizi, Bai, Yang & Ahrens, 2014: 103, fig. 6E–H, syn. n.

**Type material examined.** Syntypes: 3 ♂♂, 2 ♀♀ "Hte Birmanie Mines des Rubies 1200–2300 m Doherty 1890/ *satura* type Brsk." (MNHN).

**Additional material examined.** 1 ♂ “N THAILAND, Mae Hong Son Pref, Soppong Pai Dist. Alt 1290 m 20-21.V.1998 leg. K Masumoto/ coll. Dirk Ahrens” (ZFMK). Aedeagus: Fig. 37A–C. Habitus: Fig. 37D.

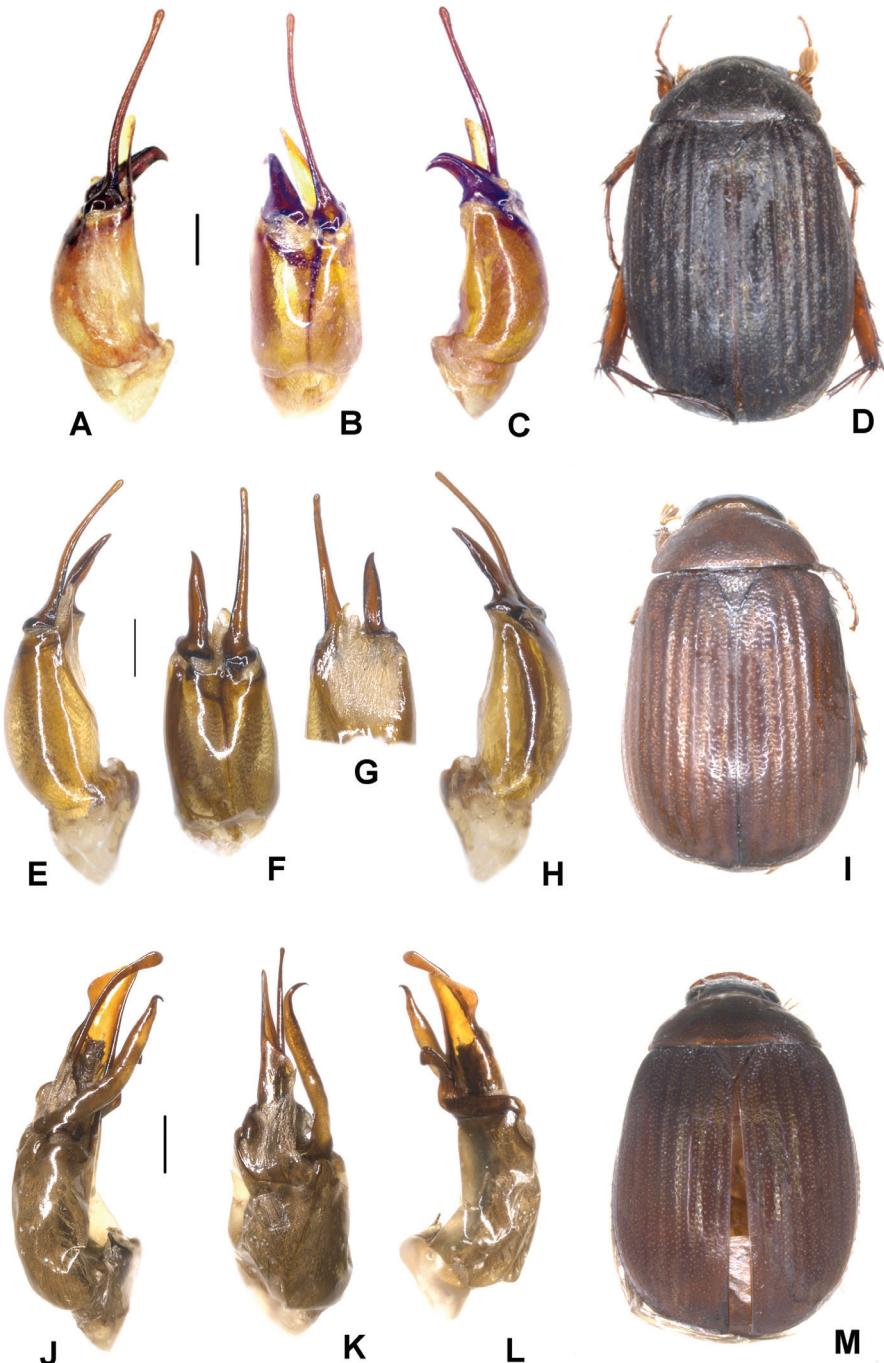

**Remarks.** The holotype of *Tetraserica graciliforceps* Liu et al., 2014 is virtually identical with the male syntypes of *Tetraserica satura* (Brenske, 1898) in shape of parameres; therefore the former is assigned a junior synonym of *T. satura*.

***Tetraserica filiforceps* sp. n.**

<http://zoobank.org/22609FB7-9667-4538-A52D-6CBD8703A896>

Figures 37, 48

**Figure 37.** **A–D** *Tetraserica satra* (Brenske, 1898) (holotype of *T. graciliforceps*) **E–I** *T. filiforceps* sp. n. (holotype) **J–M** *T. spanglerorum* sp. n. (holotype) **A, E, J** aedeagus, left side lateral view **C, H, L** aedeagus, right side lateral view **B, F, K** parameres, dorsal view **G** parameres, ventral view **D, I, M** habitus. Scale bars: 0.5 mm. Habitus not to scale.

Basel, NMPC Prague, Laos 2009, Expedition: M. Brancucci, M. Geiser, Z. Kraus, D. Hauck, V. Kubáň/ 914 Sericini Asia spec.” (NHMB), 2 ♂♂ “Vietnam N (Sa Pa) Lao Cai Prov., 250 km from Hanoi bearin 31°, Sa Pa vill. Env. Hoang Lien Son Nat. Res., 25.VI.-5.VII.1998 1250 m leg. A. Naplolov” (CNAR).

**Description.** Length of body: 9.1 mm; length of elytra: 6.6 mm; maximum width: 5 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.53. Ratio of length of metepisternum/metacoxa: 1/1.43. Metatibia moderately long and wide, ratio width/length: 1/3.58; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 37E–H. Habitus: Fig. 37I.

Female unknown.

**Variation.** Length of body: 9.1–9.2 mm; length of elytra: 6.6–7.1 mm; maximum width: 5.0–5.9 mm.

**Diagnosis.** *Tetraserica filiforceps* sp. n. differs from the very similar *T. satuna* (Brenske, 1898) by the left paramere, which is slightly shorter than phallobase, and the right paramere which is nearly straight (lateral view).

**Etymology.** The name of the new species (noun in apposition) is derived from the combined Latin words *filum* (string/ filament) and *forceps*, with reference to the filiform parameres.

### *Tetraserica spanglerorum* sp. n.

<http://zoobank.org/FFA9116C-99A6-4F03-A859-FA88ADA634F3>

Figures 37, 51

**Type material examined.** Holotype: ♂ “THAILAND: Nkn. Ratcha. Prov. Nakhon Ratchasima 60 km S. 2-4 Mar 1971, P & P Spangler/ Sakaerat Expt. Sta. 14°30'N, 101°55'E, 300–600 meters/ collected at white light trap/ 910 Sericini Asia spec.” (USNM). Paratypes: 11 ♂♂, 4 ♀♀ “THAILAND: Nkn. Ratcha. Prov. Nakhon Ratchasima 60 km S., 2-4 Mar 1971, P & P Spangler/ Sakaerat Expt. Sta. 14°30'N, 101°55'E, 300–600 meters/ collected at white light trap” (USNM, ZFMK).

**Description.** Length of body: 7.8 mm; length of elytra: 6.3 mm; maximum width: 5.4 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.54. Ratio of length of metepisternum/metacoxa: 1/1.88. Metatibia short and wide, ratio width/ length: 1/3.14; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 37J–L. Habitus: Fig. 37M.

**Variation.** Length of body: 7.7–7.8 mm; length of elytra: 5.7–6.3 mm; maximum width: 5.2–5.4 mm. Female: Antennal club with three antennomeres, as long as remaining antennomeres combined; eyes as large as in male; pygidium flat.

**Diagnosis.** The shape of the aedeagus in *Tetraserica spanglerorum* sp. n. is similar to that of *T. loeiensis* sp. n.; *T. spanglerorum* sp. n. differs by the dorsal lobe of left para-

mere being distinctly wider than the ventral one and slightly curved (dorsal view); also its right paramere is bent in a nearly sharp angle at the middle.

**Etymology.** The new species is named after its collectors, P & P Spangler (noun in genitive case, plural).

***Tetraserica shanensis* sp. n.**

<http://zoobank.org/A5C021A8-F6CE-4F75-B5BE-BB01403F55B8>

Figures 38, 50

**Type material examined.** Holotype: ♂ “Burma (Myanmar) SW Shan state Taunggyi J. Rejsek 1.-18.6.1997/ coll. Dirk Ahrens/ 213 Sericini Asia spec.” (ZFMK). Paratypes: 3 ♂♂ “Burma (Myanmar) SW Shan state Taunggyi J. Rejsek 1.-18.6.1997/ coll. Dirk Ahrens” (ZFMK), 2 ♂♂, 6 ♀♀ “Burma (Myanmar) SW Shan state Taunggyi J. Rejsek [sic!] 1.-18.6.1997” (ZFMK).

**Description.** Length of body: 7.1 mm; length of elytra: 4.9 mm; maximum width: 4.1 mm. Body yellowish brown, head darker. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.71. Ratio of length of metepisternum/metacoxa: 1/1.57. Metatibia short and wide, ratio width/length: 1/3.18; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 38A–C. Habitus: Fig. 38D.

**Variation.** Length of body: 7.1–8.3 mm; length of elytra: 4.9–5.6 mm; maximum width: 4.1–4.4 mm. Female: Antennal club with three antennomeres, as long as remaining antennomeres combined; eyes as large as in male; pygidium weakly convex at apex.

**Diagnosis.** *Tetraserica shanensis* sp. n. differs from all other *Tetraserica* species in having evenly long spines on ventral margin of metatibia, and in the colour of the dorsal surface being yellowish brown.

**Etymology.** The new species is named with reference to its occurrence in the Shan state (adjective in the nominative singular).

***Tetraserica semishanensis* sp. n.**

Figures 38, 55

**Type material examined.** Holotype: ♂ “Birmania, S. S. S. Palaing, 1450 m. VI-1936 R. Perego/ MSN Milano” (MSNM). Paratypes: 1 ♂ “THAI 1-8.V.1993 SOPPONG PAI 1800 m Pacholátko & Dembický leg./ Coll. Pacholátko” (CPPB), 1 ♂ “THAI 1-8.V.1993 SOPPONG PAI 1800 m Pacholátko & Dembický leg./ Coll. Pacholátko/ 475 Sericini Asia spec.” (CPPB), 9 ♂♂ “NW Thailand, 19.19N, 97.59E, Mae Hong Son, 1991, Ban Huai Po, 1600–2000 m 17.-23.5. L. Dembický leg./ NHM Wien”

(NHMW, ZFMK), 1 ♂, 1 ♀ “NW Thailand, 9.-16.51991 Mae Hong Son Ban Huai Po, 1600–2000 m J. Horak leg.” (ZFMK), 1 ♂ “Thailand bor. Hang Dong 6.1990. lgt. Wimmer” (ZFMK), 2 ♂♂, 3 ♀♀ “Thailand centr. Pa-Sak Fl. –IX.80 Rhetchabun-600 m.” (ZFMK).

**Description.** Length of body: 7.6 mm; length of elytra: 5.1 mm; maximum width: 4.4 mm. Body yellowish brown, head darker. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.68. Ratio of length of metepisternum/metacoxa: 1/1.59. Metatibia short and wide, ratio width/length: 1/3.09; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 38E–G. Habitus: Fig. 38H.

**Variation.** Length of body: 7.1–7.6 mm; length of elytra: 5.0–5.1 mm; maximum width: 4.1–4.4 mm. Female: Antennal club with three antennomeres, as long as remaining antennomeres combined; eyes as large as in male; pygidium weakly convex at apex.

**Diagnosis.** *Tetraserica semishanensis* sp. n. differs from the similar *T. shanensis* sp. n. by the narrower, nearly straight ventral lobe of left paramere (lateral view) and the dorsal lobe of left paramere being nearly evenly narrowed towards apex (rather than bluntly widened before apex, as in *T. shanensis*).

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Latin words *semi-* (half) and the species name *shanensis*, with reference to the similarity to *T. shanensis* sp. n.

### *Tetraserica sejugata* (Brenske, 1898), comb. n.

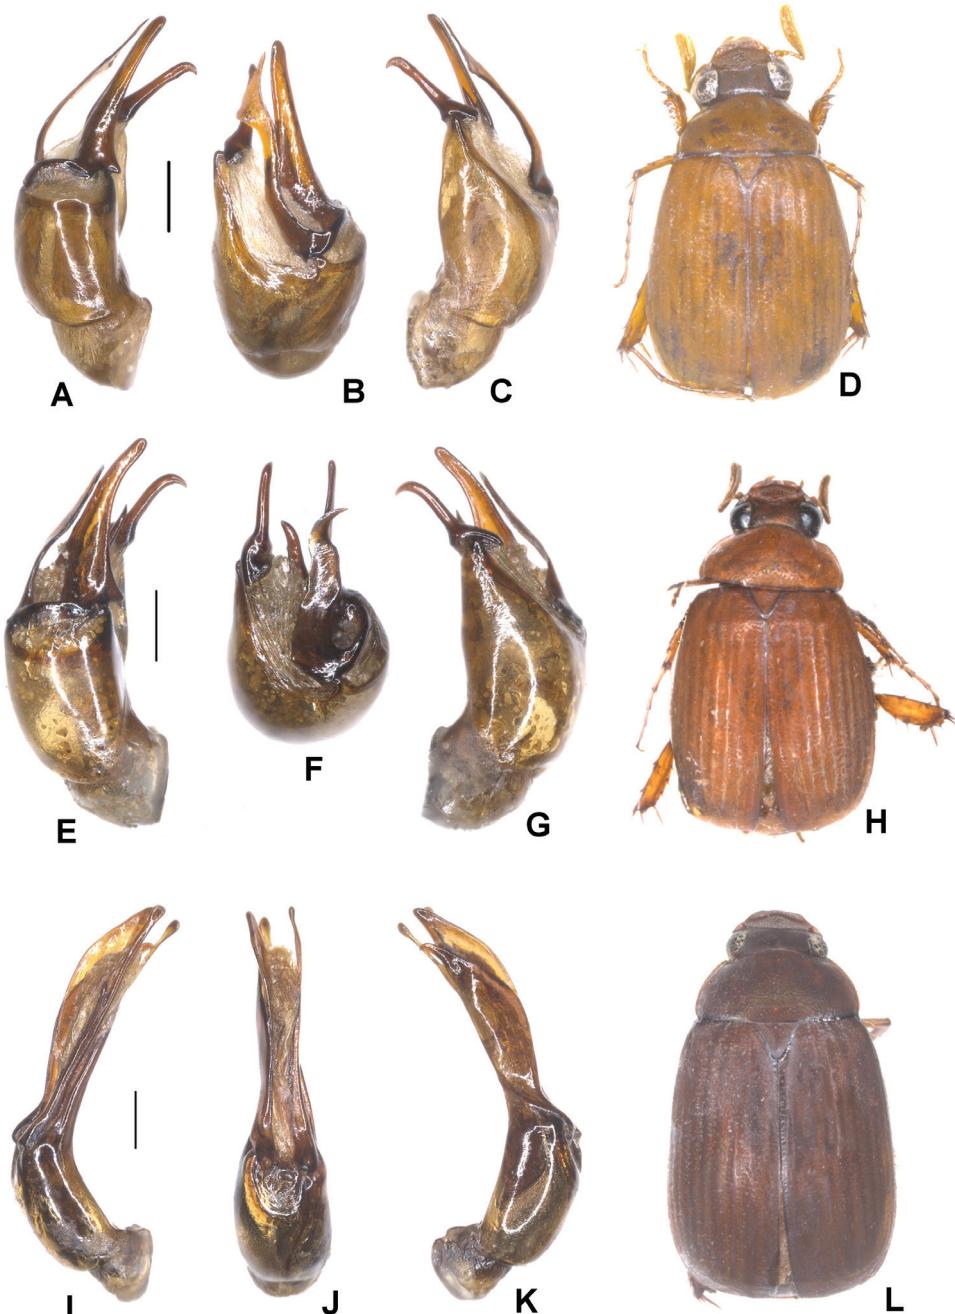

Figures 38, 50

*Serica sejugata* Brenske, 1898: 323.

Itoh leg.” (ZFMK), 1 ♂ “Thailand occ. 08.-12.04.1991 Sangkhlaburi Jan Farkac leg.” (NHMB).

**Description.** Length of body: 9.6 mm; length of elytra: 7.6 mm; maximum width: 6 mm. Surface of labrolypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.48. Ratio of length of metepisternum/metacoxa: 1/1.79. Metatibia short and wide, ratio width/length: 1/2.95; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 39E–H. Habitus: Fig. 39I.

**Variation.** Length of body: 8.8–10.1 mm; length of elytra: 6.6–7.7 mm; maximum width: 5.9–6.1 mm. Female: Eyes as large as in male; antennal club composed of three antennomeres, club as long as remaining antennomeres combined; pygidium flat.

**Diagnosis.** *Tetraserica veliformis* sp. n. differs from all other *Tetraserica* species in having a straight or convex posterior margin of metafemur and by the left paramere having a large triangular dorsomedian extension.

**Etymology.** The name of the new species (noun in apposition) is derived from the combined Latin words *velum* (sail) and *formis* (in shape), with reference to the large triangle-shaped tooth of the left paramere.

### *Tetraserica latefemorata* Kobayashi, 2017

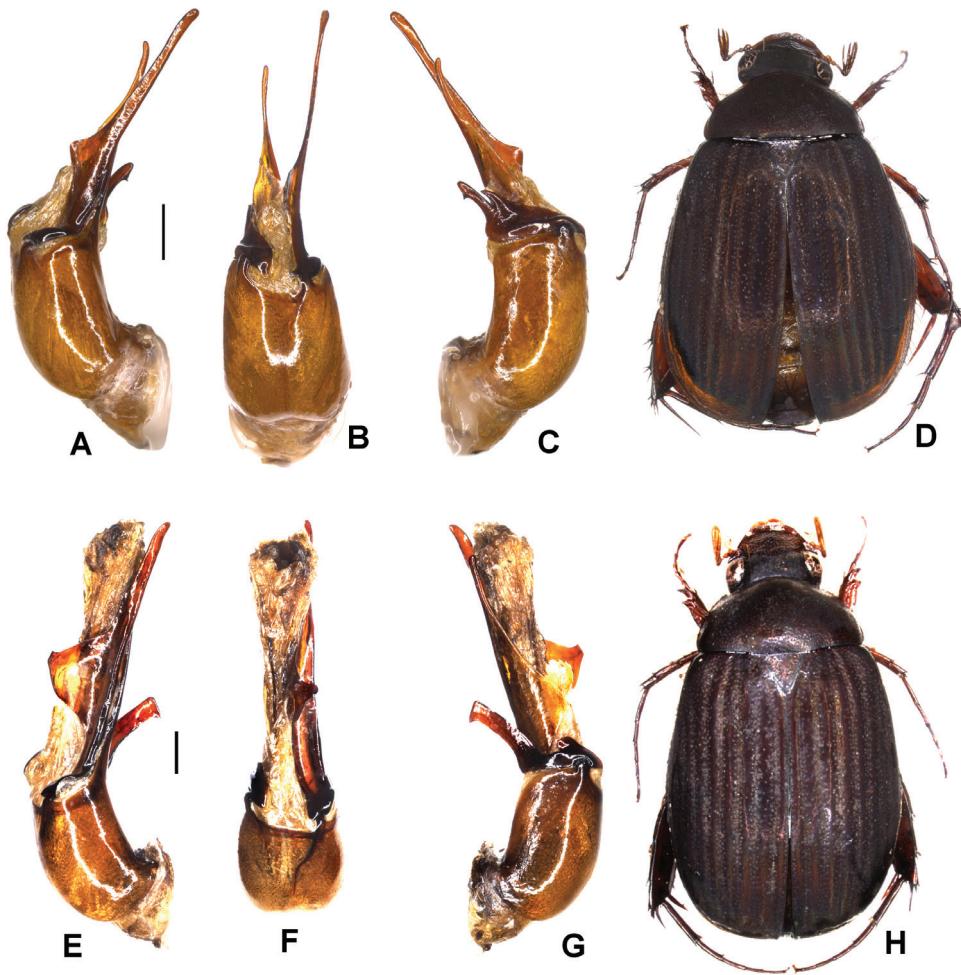

Figures 40, 49

*Tetraserica latefemorata* Kobayashi, 2017: 35, figs 2, 11.

**Material examined.** 2 ♂♂ “THAI: SOPPONG 1-9.5.2000 MORAVEC PETER/ 923 Sericini Asia spec.” (ZFMK), 1 ♂ “Thailand Pai env. 1.5.-14.5.2001 J. Hromádka lgt.” (ZFMK).

**Redescription.** Length of body: 9.6 mm; length of elytra: 7.1 mm; maximum width: 6.4 mm. Surface of labrolypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.47. Ratio of length of metepisternum/metacoxa: 1/1.77. Metatibia short and wide, ratio width/length: 1/2.45; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 40A–C. Habitus: Fig. 40D.

**Figure 40.** **A–D** *Tetraserica latefemorata* Kobayashi, 2017 (Thailand, Soppong) **E–H** *T. umphangensis* sp. n. ***Tetraserica umphangensis* sp. n.**

<http://zoobank.org/3DE9C1ED-0561-4DB9-9E09-25DB95D3FE85>

Figures 40, 51

**Type material examined.** Holotype: ♂ “Thai 28/4 - 6/5.91 Umphang river 1000 m 16°07'N, 98°00'E, David Kral lgt./ 1015 Asia Sericini spec.” (NMPC). Paratype: 1 ♂ “Thai 26/4 - 6/5.91 Umphang 500 m 16°04'N, 98°53'E, David Kral lgt.” (ZFMK).

**Description.** Length of body: 8.6 mm; length of elytra: 6.6 mm; maximum width: 5.3 mm. Surface of labroclupeus and disc of frons glabrous. Smooth area anterior to

eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.57. Ratio of length of metepisternum/metacoxa: 1/1.78. Metatibia short and wide, ratio width/length: 1/3.2; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 40E–G. Habitus: Fig. 40H.

Female unknown.

**Variation.** Length of body: 8.6–10.0 mm; length of elytra: 6.6–7.2 mm; maximum width: 5.3–5.8 mm.

**Diagnosis.** *Tetraserica umphangensis* sp. n. is rather similar to *T. veliformis* sp. n.; *T. umphangensis* sp. n. differs by the right paramere being only half as long as left paramere, and the dorsal lobe of the right paramere, which is distinctly shorter than the ventral lobe. In *T. veliformis* the right paramere is slightly more than half as long as left paramere, and the split between lobes of the right paramere is deep, the dorsal lobe is as long as the ventral lobe.

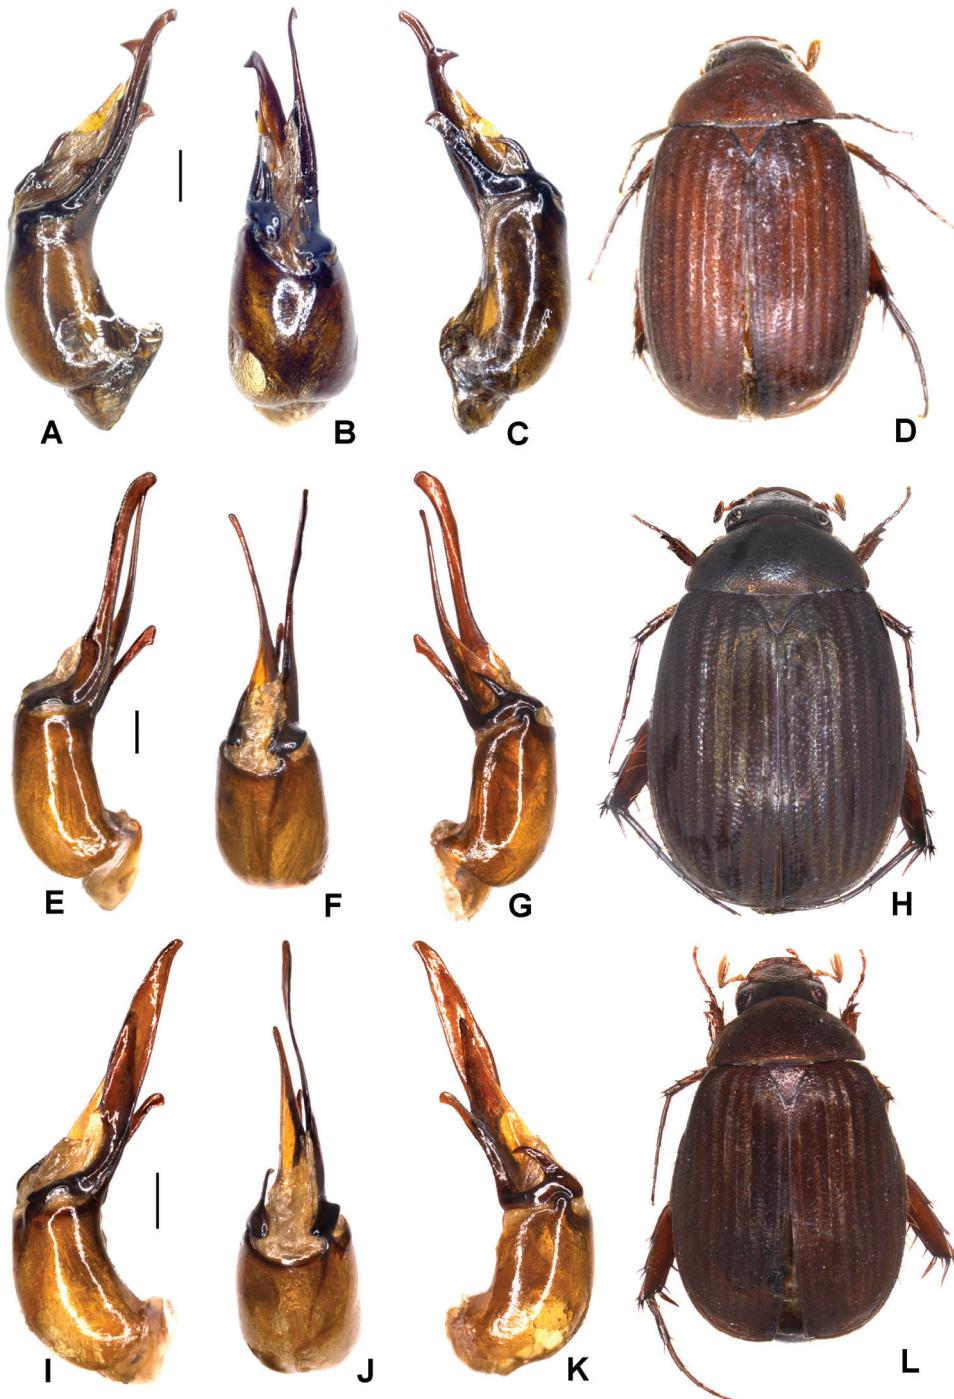

**Etymology.** The new species is named after the type locality, Umphang River (adjective in the nominative singular).

### *Tetraserica bolavensis* sp. n.

<http://zoobank.org/E47115B9-655E-48B1-A314-F61E717D9873>

Figures 41, 46

**Type material examined.** Holotype: ♂ “Laos, Attapeu prov. Bolavens Plateau, bridge ca. 4 km E TAD KATAMTOK (at light) 15°07.8'N, 106°40.1'E, 260 m Jiří Hájek leg. 11-12.v.2010/ 929 Sericini Asia spec.” (NMPC). Paratypes: 8 ♂♂ “Laos, Attapeu prov. Bolavens Plateau, bridge ca. 4 km E TAD KATAMTOK (at light) 15°07.8'N, 106°40.1'E, 260 m Jiří Hájek leg. 11-12.v.2010” (NMPC, ZFMK).

**Description.** Length of body: 8.9 mm; length of elytra: 6.5 mm; maximum width: 5.5 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.48. Ratio of length of metepisternum/metacoxa: 1/1.93. Metatibia short and wide, ratio width/length: 1/2.82; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 41E–G. Habitus: Fig. 41H.

Female unknown.

**Variation.** Length of body: 8.6–8.9 mm; length of elytra: 6.1–6.8 mm; maximum width: 5.3–5.9 mm.

**Diagnosis.** *Tetraserica bolavensis* sp. n. differs from the similar *T. latefemorata* Kobayashi, 2017 by the right paramere being half as long as left paramere and the deep split between lobes of right parameres; also the dorsal lobe is not reduced in size.

**Etymology.** The new species is named after the type locality, Bolavens Plateau (adjective in the nominative singular).

***Tetraserica nakaiensis* sp. n.**

<http://zoobank.org/6161C236-02E6-4921-B96D-A6BED9BEA2A6>

Figures 41, 49

**Type material examined.** Holotype: ♂ “Laos centr., Khammouan prov. NAKAI env., 4-8.5.1998, Route No 8 alt. 560 ± 20 m, N17°42.8', E 105°08.9 (GPS), E Jendek & O Šauša leg./ Coll. P Pacholátko/ 200 Sericini Asia spec.” (CPPB).

**Description.** Length of body: 8.9 mm; length of elytra: 6.6 mm; maximum width: 5.5 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.5. Ratio of length of metepisternum/metacoxa: 1/1.74. Metatibia short and wide, ratio width/length: 1/2.81; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 41I–K. Habitus: Fig. 41L.

Female unknown.

**Diagnosis.** *Tetraserica nakaiensis* sp. n. differs from the similar *T. bolavensis* sp. n. by the left paramere being at middle distinctly widened and distinctly longer than the median phallobasal lamina. In *T. bolavensis* the left paramere is narrow in the middle (lateral view) and only a little longer than the median phallobasal lamina.

**Etymology.** The new species is named with reference to its occurrence in Nakai province (adjective in the nominative singular).

***Tetraserica spinicrus* (Frey, 1972), comb. n.**

Figures 42, 54

*Neoserica spinicrus* Frey, 1972: 201.

**Type material examined.** Paratype: 1 ♂ “Laos, V 1967 Ban-Van-Eue/ Paratype Neoserica spinicrus G. Frey 1971” (CF).

**Additional material examined. Laos:** 1 ♂ “Laos 1963 Umgeb. Pak Lay/ CF” (CF), 1 ♂ “X-DA4793 labcode: VD099, LAOS, Stupa GH, 5 km W Muang Sing, 750 m, 21.1482N 101.1711E, 9.v-2.vi.2011, M. Murzin, O. Shulga leg. *Tetraserica*

Pacholátko/LS 55” (CPPB), 1 ♂ “Haut Mekong Vien Poukha 3.V.1918 R.V. de Salvazza” (NHMUK).

**Redescription.** Length of body: 9.1 mm; length of elytra: 6.8 mm; maximum width: 5.6 mm. Surface of labroclipeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.61. Ratio of length of metepisternum/metacoxa: 1/1.66. Posterior margin of metafemur with sharp hook. Metatibia short and wide, ratio width/length: 1/2.47; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 42A–C. Habitus: Fig. 42D.

### *Tetraserica lucai* sp. n.

<http://zoobank.org/2C5D0801-FA2A-4AE2-AA6D-1E033FAA364B>

Figures 42, 49

**Type material examined.** Holotype: ♂ “S Vietnam, 14.10N 108.30E 40 km NW of An Khe Buon Luoi, 620–750 m 28.3-12.4.1995 Pacholátko & Dembický leg./ coll. P. Pacholátko/ 237 Sericini Asia spec.” (CPPB). Paratype: 1 ♂ “C Vietnam: Gia Lai Province, Kon Chu Rang Nature Reserve, surroundings HQ, about 900 m 14°28', 450'N, 108°32', 401'E/ leg. L. Bartolozzi, S. Bambi, A. Badinelli, V. Sbordoni- at light 8-12.V.2016 (n° Mag. 3078)” (MZUF).

**Description.** Length of body: 9.4 mm; length of elytra: 7 mm; maximum width: 6.3 mm. Surface of labroclipeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.58. Ratio of length of metepisternum/metacoxa: 1/1.63. Posterior margin of metafemur with sharp hook. Metatibia short and wide, ratio width/length: 1/2.78; basal group of dorsal spines of metatibia at first third of metatibial length.

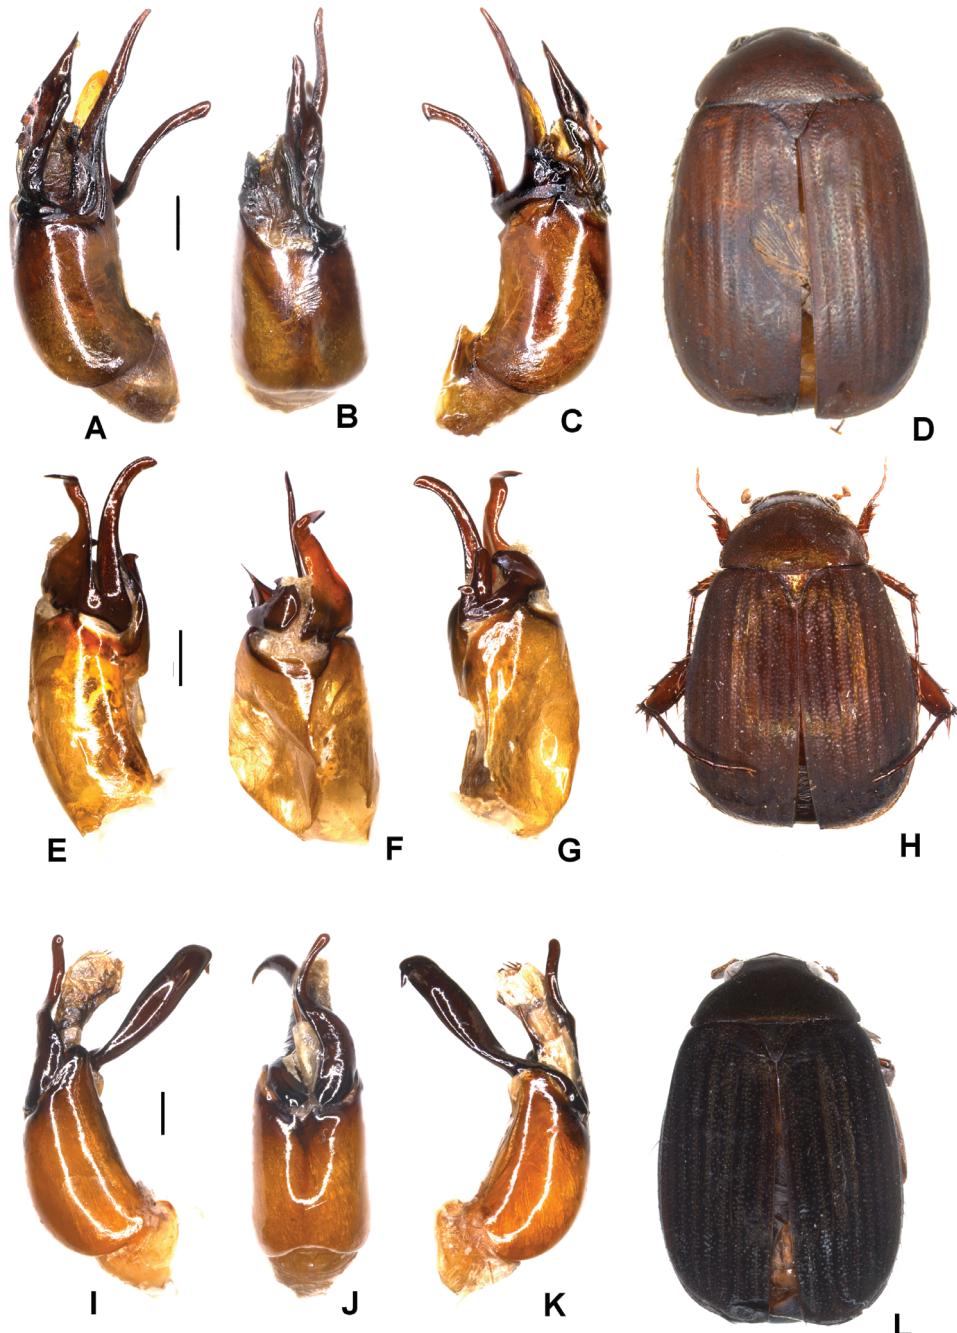

Aedeagus: Fig. 42E–G. Habitus: Fig. 42H.

Female unknown.

**Variation.** Length of body: 9.4–10.1 mm; length of elytra: 7.0–7.8 mm; maximum width: 6.2–6.3 mm.

**Diagnosis.** *Tetraserica lucai* sp. n. differs from the quite similar *T. spinicrus* (Frey, 1972) by having the metafemur not widened basally, and the sharp hook positioned behind the basal third of the metafemur.

**Etymology.** The new species is named after one of its collectors, Dr Luca Bartolozzi (noun in genitive singular).

**Figure 42.** **A–D** *Tetraserica spinicrus* (Frey, 1972) (paratype) **E–H** *T. luai* sp. n. (holotype) **I–L** *T. petratcholatkoi* sp. n. Figures 42, 51

**Type material examined.** Holotype: ♂ “X-DA4697 labcode: VD087 VIETNAM Vinh Phuc Prov., Tam Dao National Park (950 m) 1-4/VI/2013, Legit L. Bartolozzi, S. Bambi, F. Cianferoni, G. Mazza, E. Orbach (n° Mag. 2950), Leihgabe Florenz, Tetraserica sp VI\_V48/ 241 Sericini Asia spec./ X-DA4697” (VNMN). Paratype: 1 ♂ “N-Vietnam, (TONKIN) TAMDAO 12-24.5.1989. Pacholátko/ coll. P. Pacholátko/ VS 47” (CPPB).

**Description.** Length of body: 10 mm; length of elytra: 8.1 mm; maximum width: 6.5 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.59. Ratio of length of metepisternum/metacoxa: 1/1.6. Metatibia moderately long and wide, ratio width/length: 1/3.33; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 42I–K. Habitus: Fig. 42L.

Female unknown.

**Variation.** Length of body: 9.8–10.0 mm; length of elytra: 7.1–8.1 mm; maximum width: 6.0–6.5 mm.

**Diagnosis.** *Tetraserica petrpacholatkoi* sp. n. differs from *T. constanti* sp. n. and *T. vientianeensis* sp. n. by the left paramere being half as long as the phallobase.

**Etymology.** The new species is named after one of its collectors, Petr Pacholátko (noun in genitive singular).

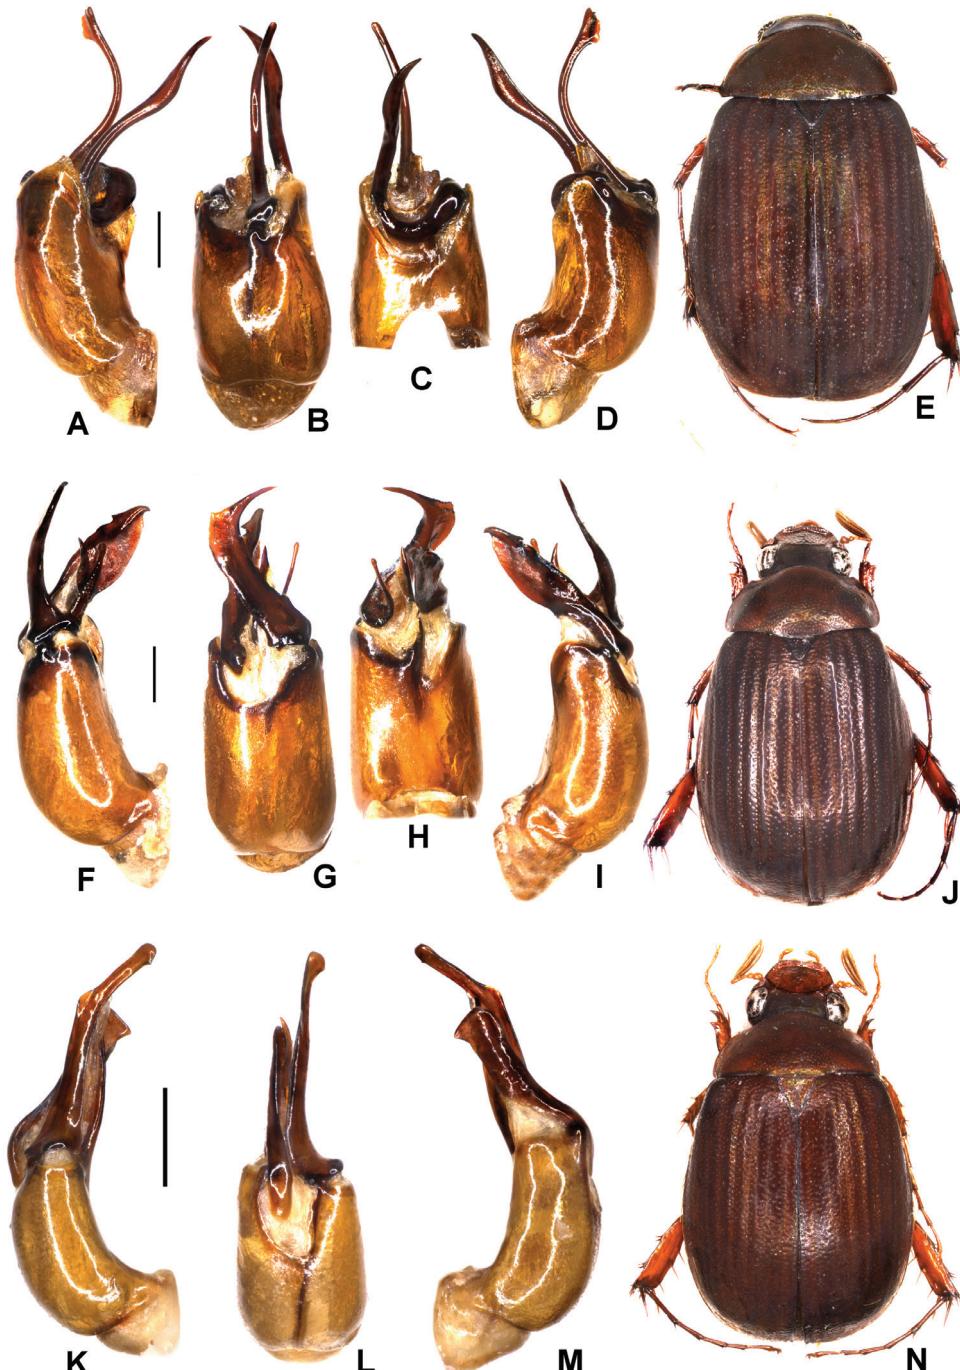

***Tetraserica senohi* Kobayashi, 2018**

Scale bars: 0.5 mm. Habitus not to scale.

Ratio of length of metepisternum/metacoxa: 1/1.68. Metatibia short and wide, ratio width/length: 1/3.21; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 43A–D. Habitus: Fig. 43E.

***Tetraserica rihai* sp. n.**

<http://zoobank.org/B11102C4-9B53-48E5-B19B-C4163F4E4C67>

Figures 43, 50

**Type material examined.** Holotype: ♂ “Thai, N, Nan prov., Doi Phu Kha N.P., Headq., 19°13'N, 101°07'E, 28.iv-1.v.1999, M. Riha leg./ coll. P. Pacholátko/ 124 Sericini Asia spec.” (CPPB).

**Description.** Length of body: 9.5 mm; length of elytra: 6.5 mm; maximum width: 5.5 mm. Surface of labroclipeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.56. Ratio of length of metepisternum/metacoxa: 1/1.69. Metatibia short and wide, ratio width/length: 1/3.06; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 43F–I. Habitus: Fig. 43J.

Female unknown.

**Diagnosis.** *Tetraserica rihai* sp. n. differs from *T. nonglomensis* sp. n. and *T. nussi* sp. n. by the dorsal lobe of left paramere being twice as long as the median ventral lamina of phallobase.

**Etymology.** The new species is named after one of its collectors, M Riha (noun in genitive singular).

***Tetraserica doipuiensis* sp. n.**

<http://zoobank.org/B2DEA154-A5AE-4134-8CB1-54E597057D84>

Figures 43, 49

**Type material examined.** Holotype: ♂ “Thai, Chiang Mai prov., 18°49'N, 98°54'E, 1600 m, DOI PUI mt., 2-6.v., Vít Kubáň leg.1996/ coll. P Pacholátko/ 899 Sericini Asia spec.” (CPPB).

**Description.** Length of body: 6.3 mm; length of elytra: 4.5 mm; maximum width: 3.8 mm. Surface of labroclipeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes moderately large, ratio of diameter/interocular width: 0.62. Ratio of length of metepisternum/metacoxa: 1/1.55. Metatibia short and wide, ratio width/length: 1/3.1; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 43K–M. Habitus: Fig. 43N.

Female unknown.

**Diagnosis.** *Tetraserica doipuiensis* sp. n. differs from the similar *T. champassakana* sp. n. by the left paramere lacking the blunt lateral tooth before the apex and the right paramere being as long as medial phallobasal lamina.

**Etymology.** The new species is named after the type locality, Mt Doi Pui (adjective in the nominative singular).

***Tetraserica doiphukhaensis* sp. n.**

<http://zoobank.org/E1AC2466-836E-4B50-9375-18A16C741DB6>

Figures 44, 46

**Type material examined.** Holotype: ♂ “Thai, N, Nan prov., Doi Phu Kha N.P, Headq., 19°13'N, 101°7'E, 28.iv-1.v.1999., M Riha leg. /coll. P Pacholátko/ 139 Sericini Asia spec.” (CPPB).

**Description.** Length of body: 8.8 mm; length of elytra: 6.3 mm; maximum width: 5.3 mm. Surface of labroclipeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.54. Ratio of length of metepisternum/metacoxa: 1/1.75. Metatibia moderately long and wide, ratio width/length: 1/3.5; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 44A–C. Habitus: Fig. 44D.

Female unknown.

**Diagnosis.** *Tetraserica doiphukhaensis* sp. n. differs from all other *Tetraserica* in having a very short median phallobasal lamina, by having the left paramere short and stout, and a simple right paramere without a dorsal lobe.

**Etymology.** The new species is named after the type locality, Doi Phu Kha NP (adjective in the nominative singular).

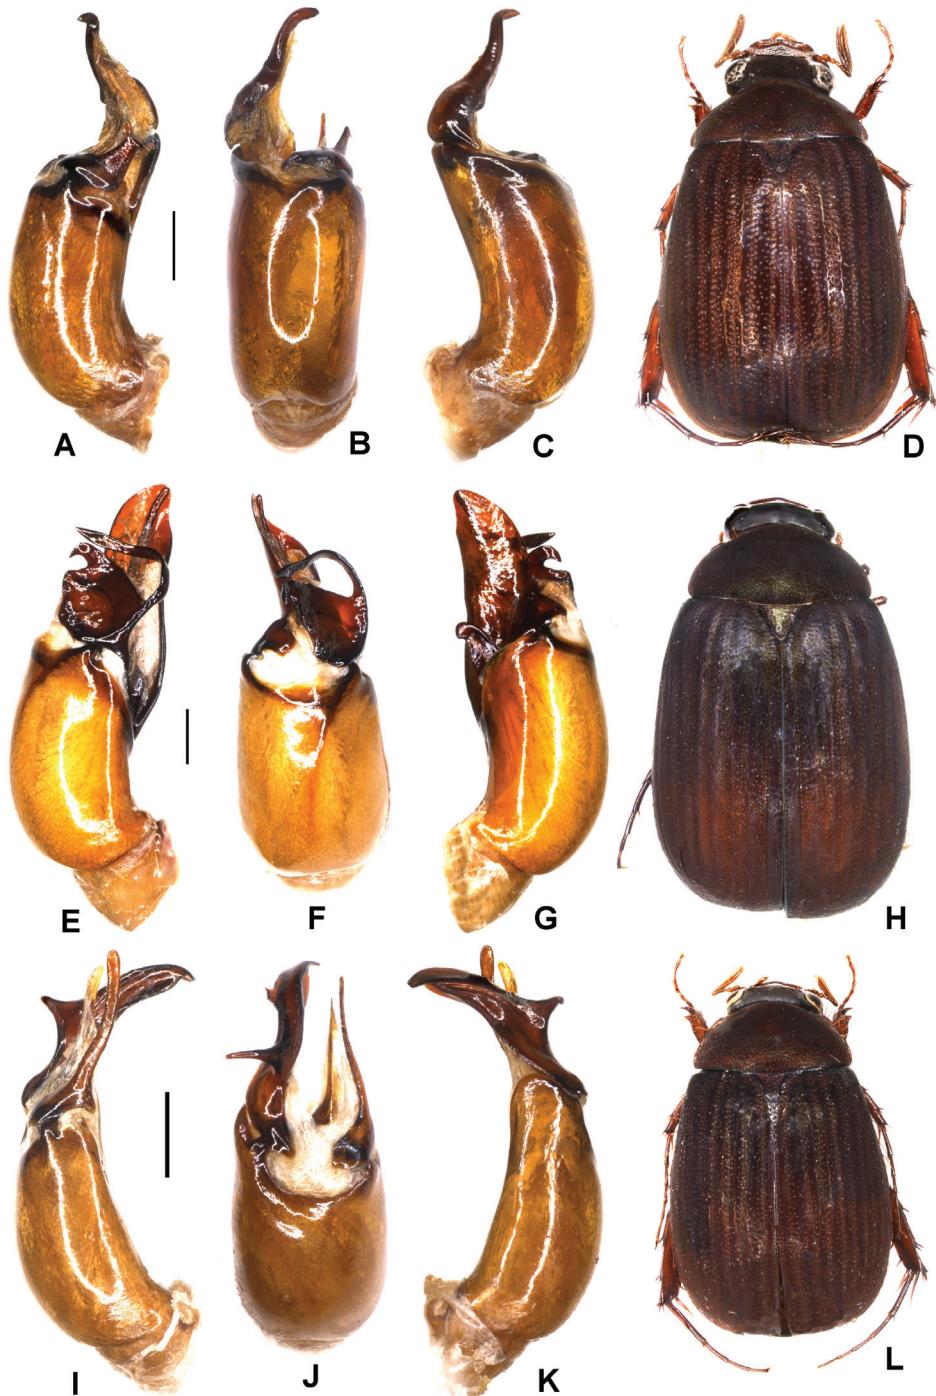

***Tetraserica kontumensis* sp. n.**

<http://zoobank.org/2304423E-00A3-41DE-9C88-A6DFE74C6CFB>

Figures 44, 48

**Type material examined.** Holotype: ♂ “X-DA4692 labcode VD085, VIETNAM, Kon Tum Prov. W border of Ngoc Linh Nat. Park, 20 km N Dak Glei (900 m) (at light), 5°14'26.04"N, 107°44'11.61"E, 30.V.2014, legit L Bartolozzi, G Chelazzi, A Bandinelli, S Bambi, F Fabiano (n° Magazz. 2978) *Tetraserica* spVI\_V46” (VNMN).

**Description.** Length of body: 10 mm; length of elytra: 7.4 mm; maximum width: 6.1 mm. Surface of labroclipeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.52. Ratio of length of metepisternum/metacoxa: 1/1.7. Posterior margin of metafemur with

**Figure 44.** **A–D** *Tetraserica doiphukhaensis* sp. n. (holotype) **E–H** *T. kontumensis* sp. n. (holotype) **I–L** *T. semidamadiensis* sp. n. (holotype) **A, E, I** aedeagus, left side lateral view **C, G, K** aedeagus, right side lateral view **B, F, J** parameres, dorsal view **D, H, L** habitus. Scale bars: 0.5 mm. sharp hook. Metatibia short and wide, ratio width/length: 1/3.17; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 44E–G. Habitus: Fig. 44H.

Female unknown.

**Diagnosis.** *Tetraserica kontumensis* sp. n. differs from all other *Tetraserica* species by having a short and wide left paramere, split into a dorsal hook and a basal filiform branch which is also turned dorsally.

**Etymology.** The new species is named with reference to its occurrence in the Kon Tum province (adjective in the nominative singular).

**Remarks.** The correct GPS coordinates of the type locality are 15°14'26.04"N, 107°44'11.61"E.

***Tetraserica semidamadiensis* sp. n.**

<http://zoobank.org/BAADD476-7EB1-494F-BE2B-CC5FC47B1F5F>

Figures 44, 51

**Type material examined.** Holotype: ♂ “Laos centr., Bolikhambang prov. BAN NAPE - Kaew Nua Pass, 18.4-1.5.1998, alt. 600 ± 100 m, N 18°22.3, E105°09.1 (GPS), E Jendek & O Šauša leg./ coll. P. Pacholátko/ 199 Sericini Asia spec.” (CPPB).

**Description.** Length of body: 7.8 mm; length of elytra: 5.6 mm; maximum width: 5 mm. Surface of labroclypeus and disc of frons glabrous. Smooth area anterior to eye twice as wide as long. Eyes small, ratio of diameter/interocular width: 0.52. Ratio of length of metepisternum/metacoxa: 1/1.56. Metatibia moderately long and wide, ratio width/length: 1/3.75; basal group of dorsal spines of metatibia at first third of metatibial length.

Aedeagus: Fig. 44I–K. Habitus: Fig. 44L.

Female unknown.

**Diagnosis.** *Tetraserica semidamadiensis* sp. n. is very similar to *T. damadiensis* Liu et al., 2014 but the new species differs by the dorsolateral tooth being situated at the basal third of the right paramere, and by the wider right paramere (lateral view).

**Etymology.** The species name (adjective in the nominative singular) is derived from the combined Latin words *semi-* (half) and the species name *damadiensis*, with reference to the similarity to *T. damadiensis* Liu et al., 2014.

***Tetraserica damadiensis* Liu, Fabrizi, Bai, Yang, Ahrens, 2014**
