Citation: Castro D, Scheffrahn RH (2019) A new species of *Acorhinotermes* Emerson, 1949 (Blattodea, Isoptera, Rhinotermitidae) from Colombia, with a key to Neotropical Rhinotermitinae species based on minor soldiers. ZooKeys 891: 61–70. <https://doi.org/10.3897/zookeys.891.37523>

Abstract

Acorhinotermes Emerson, 1949 is the only Neotropical Rhinotermitine genus with no major soldier. Herein *Acorhinotermes claritae* Castro & Scheffrahn, **sp. nov.** is described based on minor soldiers and an alate nymph collected in a secondary rain forest in the Colombian Amazon. The minor soldier of *A. claritae* Castro & Scheffrahn, **sp. nov.** has longer mandibular points and it is comparatively smaller than *A. subfusciceps*. An illustrated key to the minor soldiers of the Neotropical species of Rhinotermitinae is presented.

Keywords

Colombian Amazon, *Dolichorhinotermes*, *Rhinotermes*, taxonomy, termites

Introduction

The subfamily Rhinotermitinae Froggatt, 1897 comprises worldwide the genera *Parrhinotermes* Holmgren, 1910, *Macrorhinotermes* Holmgren, 1913, *Schedorhinotermes* Silvestri, 1909, *Rhinotermes* Hagen, 1858, *Dolichorhinotermes* Snyder & Emerson, 1949, and *Acorhinotermes* Emerson, 1949. The last three genera are recorded from the Neotropical region (Maiti 2011; Krishna et al. 2013).

Acorhinotermes subfusciceps was originally described within the genus *Rhinotermes* (Emerson 1925; Snyder 1949). Emerson in Snyder (1949) transferred *Rhinotermes subfusciceps* to a new genus, *Acorhinotermes*, straightening the absence of the major soldier as a diagnostic characteristic of the genus.

Colombia has very few records of species of the subfamily Rhinotermitinae, only *Rhinotermes hispidus* Emerson, 1925 and *Rhinotermes marginalis* (Linnaeus, 1758) are reported (Pinzón et al. 2017; Constantino 2019). *Acorhinotermes* has been reported for Brazil, Guyana, French Guiana, Venezuela and Peru (Snyder 1949; Davies et al. 2003; Salick et al. 2013; Scheffrahn unpubl. data; Silva et al. 2019). Currently, only *Dolichorhinotermes japuraensis* Constantino, 1990 is endemic to the Amazon Basin (Constantino 1991). Additionally, all Rhinotermitinae species except *Dolichorhinotermes longidens* (Snyder, 1924) are found in the Amazon Region (Castro unpubl. data, Constantino 1992, Constantino and Cencello 1992, Krishna et al. 2013).

In this paper, we describe a new species *Acorhinotermes claritae* sp. nov. based on characters from the minor soldier and alate nymph. We provide as well as an illustrated key for the Neotropical Rhinotermitinae based on the minor soldier caste, which would be very helpful when major soldiers or imagoes are not represented in the collected samples.

Materials and methods

Specimens of *Acorhinotermes claritae* sp. nov. were collected in trucks of dead trees with aspirators, at weet season (July 12–19, 2018), in the southern state of Amazonas, Colombia, and preserved in 95% ethanol. The holotype and paratypes are deposited in the “Colección de Artrópodos Terrestres de la Amazonía Colombiana”, SINCHI Amazon Institute of Scientific Research, Leticia, Amazonas, Colombia (**CATAC**). Paratypes are also deposited in the Termite Collection, Fort Lauderdale Research and Education Center, University of Florida, Davie, Florida, United States of America (**UF**).

Additional material examined for the Rhinotermitine species key is deposited in the UF and the CATAC, as follows: *Acorhinotermes subfusciceps*, PERU, (-9.05222, -75.57818), 30/05/2014, R. Scheffrahn col., 376 m (PN.799.0); *Dolichorhinotermes lanciarius* Engel & Krishna, 2007, PERU, (-11.06414, -74.71955), 25/05/2014, R. Scheffrahn col., 602 m (PN.104.0); *Dolichorhinotermes longidens*, PANAMA, (9.34349, -79.77382), 4/06/2005, R. Scheffrahn col., 216 m (PN.684.0); *Dolichorhinotermes longilabius* (Emerson, 1924), FRENCH GUYANA, (5.03784, -52.95580), 7/02/2008, J.

Krêcêk col., 87 m (FG.181.0); *Rhinotermes hispidus*, BOLIVIA (-16.99937, -65.62736), 26/05/2013, R. Scheffrahn col., 491 m (BO. 163.0); *Rhinotermes marginalis*, BOLIVIA, (-16.97043, -65.21001), 26/05/2013, col. R. Scheffrahn, 231 m (BO. 76.0); *Dolichorhinotermes longilabius*, COLOMBIA, (4.343416, -69.98627), col. L. Pinedo, 101 m (CATAC-03314); *Rhinotermes hispidus*, COLOMBIA (3.8210, -67.81041), 16/03/2019, col. J. Chase, 98 m (CATA-03687); *Rhinotermes marginalis*, COLOMBIA, (-3.80044, -70.31533), col. J. Chase, 76 m (CATA-03558). In the other hand, Emerson (1925), Constantino (1990), Snyder (1924), Snyder (1926) and Desneux (1904) were consulted for those species not represented in the UF or CATA collections.

Morphological characters used for the alate nymph and minor soldier follows Roonwal (1970). Microphotographs were taken as multi-layer montages using a Leica M205C stereomicroscope controlled by Leica Application Suite version 3 software. Preserved specimens were suspended in a pool of Purell Hand Sanitizer to position the specimens on a transparent Petri dish background.

Taxonomy

Acorhinotermes claritae Castro & Scheffrahn, sp. nov.

<http://zoobank.org/92519036-1333-4086-9485-BBF1D8A33B3E>

Type material. Holotype. Minor soldier from colony CATA 2722.

Type-locality. COLOMBIA: Amazonas, Leticia (-4.08975, -69.92705).

Paratypes. COLOMBIA, Amazonas, Leticia, (-4.08975, -69.92705): 12.VII.2018, James Chase col., 87 m, 1 alate nymph, 45 minor soldiers, 156 workers (CATA 2722); 12.VII.2018, Daniela Manso col., 87 m, 11 minor soldiers, 56 workers (CATAC 2723); (-4.08900, -69.92497): 12.VII.2018, James Chase col., 91 m, 5 minor soldiers, 2 workers (CATA 2724); (-4.04875, -70.00527): 13.VII.2018, Daniela Manso col., 106 m, 33 minor soldiers, 41 workers (CATA 2750); (-4.04972, -69.92704): Daniel Castro col., 97 m, 5 minor soldiers, 4 workers (UF no. CO 918).

Diagnosis. Minor soldier head with concave lateral margins forming a posterior constriction, with prominent mandibular points extend beyond the fontanelle.

Description. Alate nymph. (Fig. 1A, B) Head capsule yellowish-brown, widely oval with numerous long bristles. Antennae with 20 articles, 2<3=4. Dorsum of body concolorous with head capsule. Compound eyes subcircular, eye margins wide and broadly separated from antennal sockets. Ocelli of small size, oval, well separated from eyes. Clypeus linguiform, not buttressed by frontal projection. Pronotum margin with numerous long bristles; rounded lateral margins. Mandibles with M1 more prominent than apical teeth. Right mandible with M1 more projected than left mandible. Left mandible with M2 projected to half the length of M1, M2 and M3 forms an obtuse angle, M3 and molar tooth projected at same distance.

Measurements (mm) for a single alate nymph: head length with labrum 1.27, head length to postclypeus 1.46, maximum width of the head with eyes 1.39, width of head

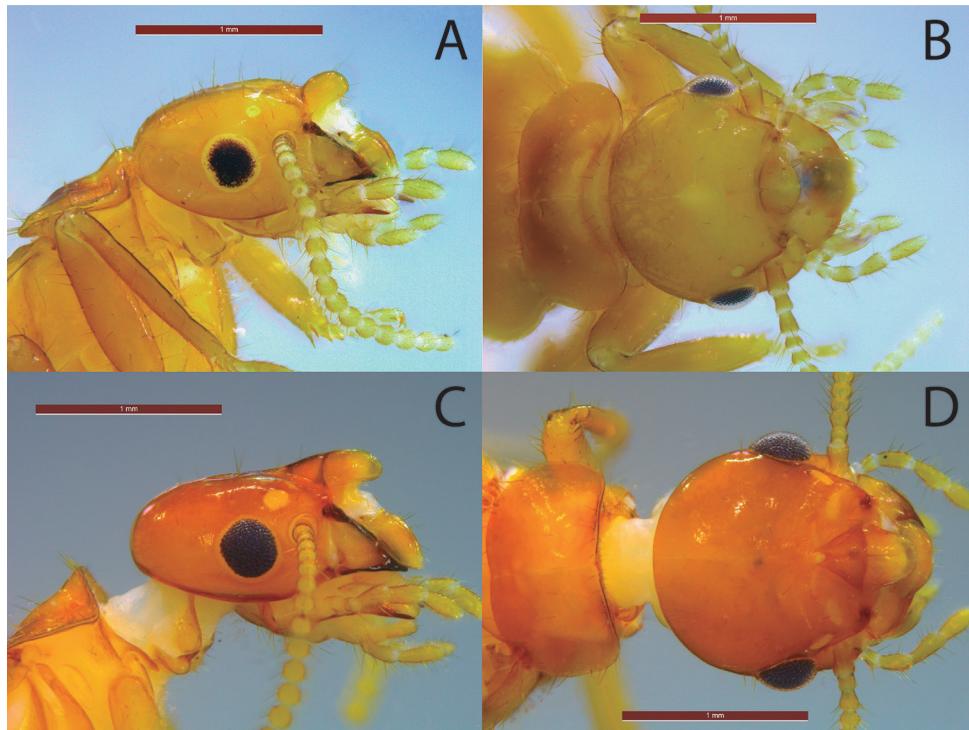

Figure 1. *Acorhinotermes* spp. **A, B** alate nymph of *Acorhinotermes claritae* sp. nov., lateral and dorsal view **C, D** imago of *Acorhinotermes subfusciceps*, lateral and dorsal view. Scale bar: 1 mm.

without eyes 1.21, diameter of eye 0.25, ocellus diameter 0.08, length of pronotum 0.78, width of pronotum 1.36, total body-length without wings 6.81.

Comparisons. *Acorhinotermes claritae* sp. nov. has more abundant bristles in lateral view. The ocelli and eyes are smaller than the *A. subfusciceps* imago, and the clypeal projection projects more acutely in *A. claritae* sp. nov. and it is not buttressed by a frontal projection as in *A. subfusciceps* (Fig. 1C).

Minor soldier. (Fig. 2; Table 1) Head capsule, in dorsal view, with concave lateral margins forming posterior constriction 10–12 long erect bristles, without microscopic hairs. Antennae with 15 or 16 articles, formula 2=3<4=5. Mandible vestigial, point long, straight and sharp. Labrum hyperelongate, broadening apically; tip bilobed; nearly in same plane as vertex in lateral view. Fontanelle at basal one-fifth of labrum. Pronotum concolorous with head, with 4–8 dispersed bristles, 2–4 in anterior margin and 2–4 in surface, pronotum without microscopic hairs. Tergites pale yellow, margins covered by dense layer of hairs. Legs with many long and short bristles; thick bristles on foretibia.

Comparisons. *Acorhinotermes claritae* sp. nov. is smaller and has longer mandibular points than *A. subfusciceps*. In profile, the dorsa of the occiput, vertex, and labrum of *A. claritae* sp. nov. form a nearly straight line, while in *A. subfusciceps* this profile

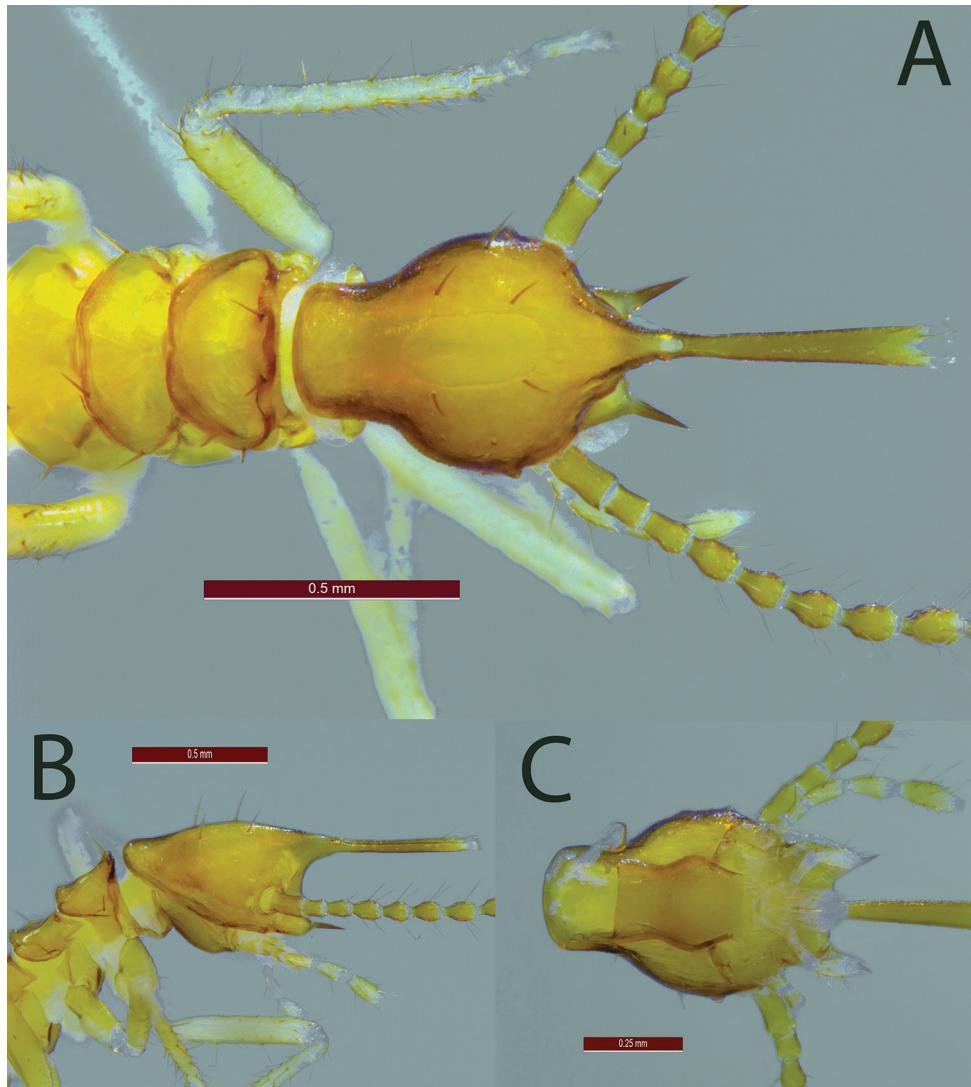

Figure 2. *Acorhinotermes claritae* sp. nov., minor soldier **A** head in dorsal view **B** head in lateral view **C** head in ventral view.

Table I. Measurements (mm) of 10 minor soldiers from three colonies of *Acorhinotermes claritae* sp. nov.

Holotype	CATAc 2722		CATAc 2723		CATAc 2724	
	Range	Mean ± SD	Range	Mean ± SD	Range	Mean ± SD
Max head width	0.53	0.45–0.58	0.53±0.05	0.53–0.63	0.58±0.03	0.55–0.66
Length head with labrum	1.30	1.18–1.36	1.31±0.06	1.23–1.38	1.32±0.05	1.23–1.40

Pronotum width	0.42	0.39–0.46	0.43±0.03	0.43–0.49	0.47±0.02	0.44–0.56
Pronotum length	0.28	0.24–0.33	0.29±0.03	0.25–0.37	0.31±0.03	0.29–0.34
Length of hind tibia	0.84	0.81–0.89	0.85±0.03	0.77–0.88	0.82±0.03	0.80–0.93

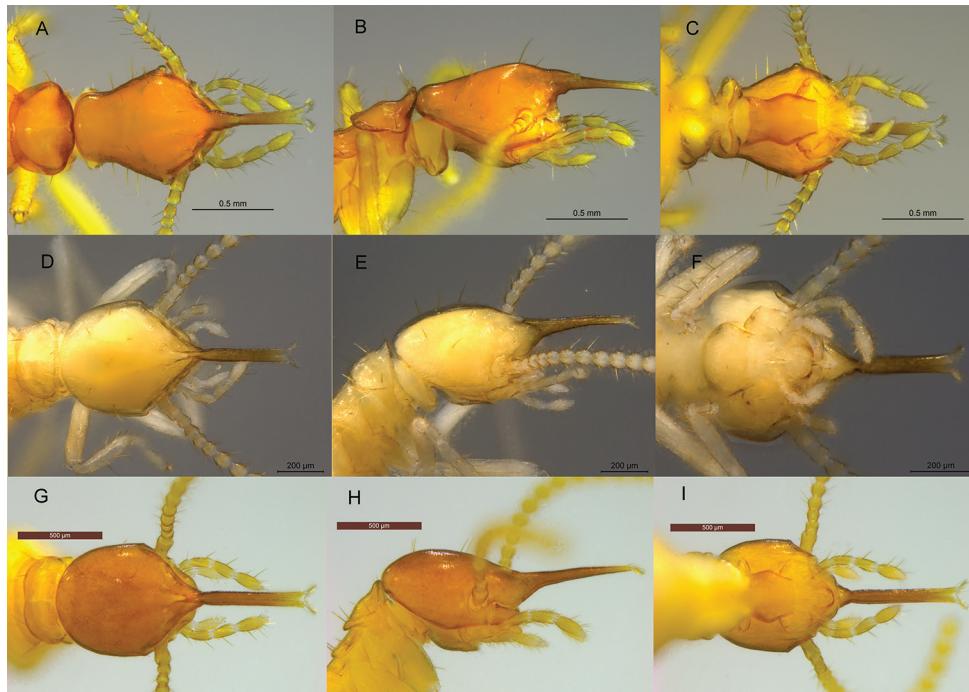

Figure 3. Minor soldiers of Neotropical Rhinotermitinae deposited in UF and CATAc termite collections
A–C *Acorhinotermes subfusciceps* **D–F** *Dolichorhinotermes longidens* **G–I** *Dolichorhinotermes lanciarius*.

forms an obtuse angle (Fig. 3A, B). All minor soldiers of *Dolichorhinotermes* and *Rhinotermitinae* have the labrum tip bifurcated (forked or divided into two parts or branches), and it is much more bilobed in *A. subfusciceps* than in *A. claritae* sp. nov.

Biological notes. *Acorhinotermes claritae* sp. nov. was collected in a secondary rain forest near the Tacana river, close to a “chagra” (indigenous agricultural production system). During the wet season, these areas are in flood zones. The colonies were found in trunks of dead trees and in big dry branches on the ground. One particular colony of this species was found in a same dead branch together with *Heterotermes tenuis* (Hagen, 1858) and *Cylindrotermes parvignatus* Emerson, 1949, and another colony with *Silvestritermes gnomus* (Constantino, 1991). *Acorhinotermes claritae* sp. nov. was collected in a unique locality near the city of Leticia, although we did surveys in other two sites of a radius no greater than 15 km, it was not collected.

Distribution. The genus *Acorhinotermes* is distributed in the Amazon basin, Guiana shield and Caatinga (Fig. 5). *A. claritae* sp. nov. is restricted to the Amazon basin.

Etymology. The species is named in honor of Dr. Clara (Clarita) Peña-Venegas, who has supported and promoted the knowledge and inventories of termites and other terrestrial arthropods from the Colombian Amazon in the SINCHI Institute.

Key to the species of Neotropical Rhinotermitinae based on minor soldiers*

- 1 In dorsal view, fontanelle anterior to mandibular lobes (bases of mandibular points) (Figs 2B, 3A) (*Acorhinotermes*) 2
- In dorsal view, fontanelle at or posterior to mandibular lobes (Figs 3D, 4A, D) 3
- 2 Mandibular points extend beyond the fontanelle (Fig. 2A) *A. claritae* sp. nov.
- Mandibular points do not extend beyond the fontanelle (Fig. 3A–C) *A. subfusciceps*
- 3 Mandibular points reduced to minute points on basal lobes (Fig. 3F, I) 4
- Long mandible points prominent, directed upward and forward (Fig. 4B, D, H) 5
- 4 Smaller species: head length less than 1.10 mm. Panama (Fig. 3D–F) *D. longidens*
- Larger species: head length more than 1.47 mm. South America (see Engel and Krishna 2007: fig. 2) *D. lanciarius*
- 5 Length of head to tip of labrum 1.35 mm or less 6
- Length of head to tip of labrum 1.45 mm or more 7
- 6 Middle of anterior margin of pronotum with numerous short bristles, small mandibles do not exceed the base of the labrum, not visible from the dorsal view (see Constantino 1990: fig. 8) *D. japuraensis*
- Middle of anterior margin of pronotum smooth, without numerous short bristles, large mandibles reaching up to the middle of the labrum, visible from the dorsal view (Fig. 4A–C) *D. longilabius***
- 7 In lateral view, about 4–10 setae visible on vertex, labrum very elongated and narrow with a slight depression at its base (Fig. 4G) 8
- In lateral view, about 20–30 setae visible on vertex, labrum elongated and width without depression at its base (Fig. 4D) 9
- 8 Head in dorsal view with a defined constriction behind antennae (Fig. 4G) *R. marginalis*, *R. nasutus****
- Head in dorsal view without constriction behind antennae, posterior margin of the head rounded (see Emerson 1925: fig. 42C) *D. tenebrosus*
- 9 Head length to labrum tip 1.70–1.93 mm (Fig. 4D–F) *R. hispidus*
- Head length to labrum tip 2.20–2.35 mm (See: Snyder (1926). Plate 1, fig. 2)... *R. manni*

* The key does not include the fossil species *Dolichorhinotermes apopnus* Engel & Krishna, 2007, *Dolichorhinotermes dominicanus* Schlemmermeyer & Cancello, 2000, and *Rhinotermes miocenicus* Nel & Paicheler, 1993.

** The species *Dolichorhinotermes latilabrum* (Snyder, 1926) and *Dolichorhinotermes neli* Ensa & Betsch, 2002 were not included in this key because we suspect they are junior synonyms of *Dolichorhinotermes longilabius* (Emerson, 1924).

*** These species cannot be separated only with the minor soldier. It is necessary the imago or the major soldier caste.

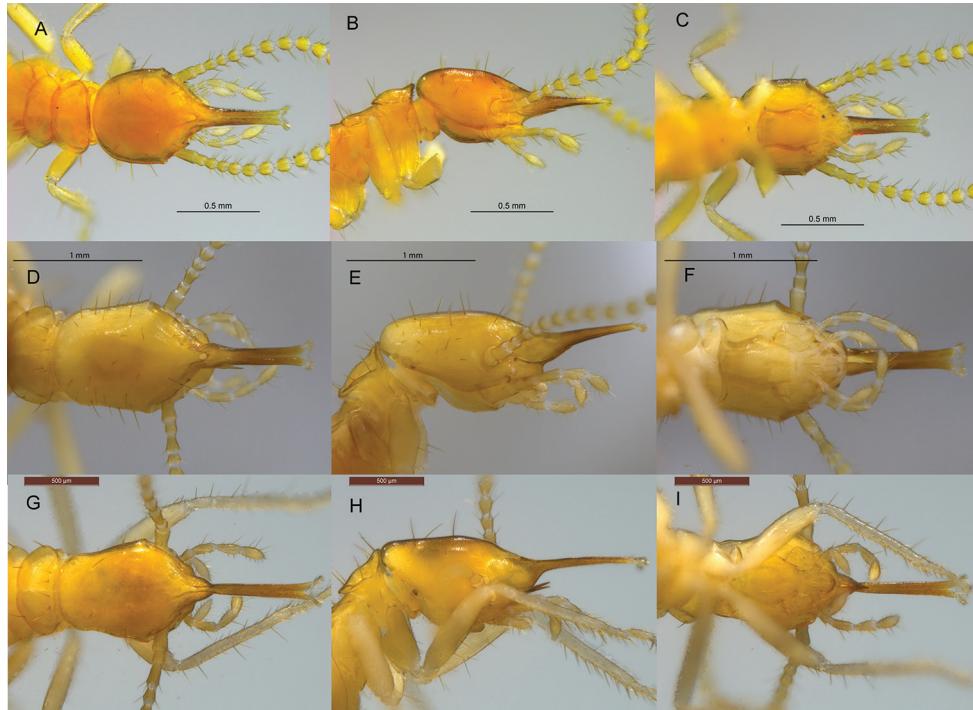

Figure 4. Minor soldiers of Neotropical Rhinotermitinae deposited in UF and CATAc termite collections **A–C** *Dolichorhinotermes longilabius* **D–F** *Rhinotermes hispidus* **G–I** *Rhinotermes marginalis*.

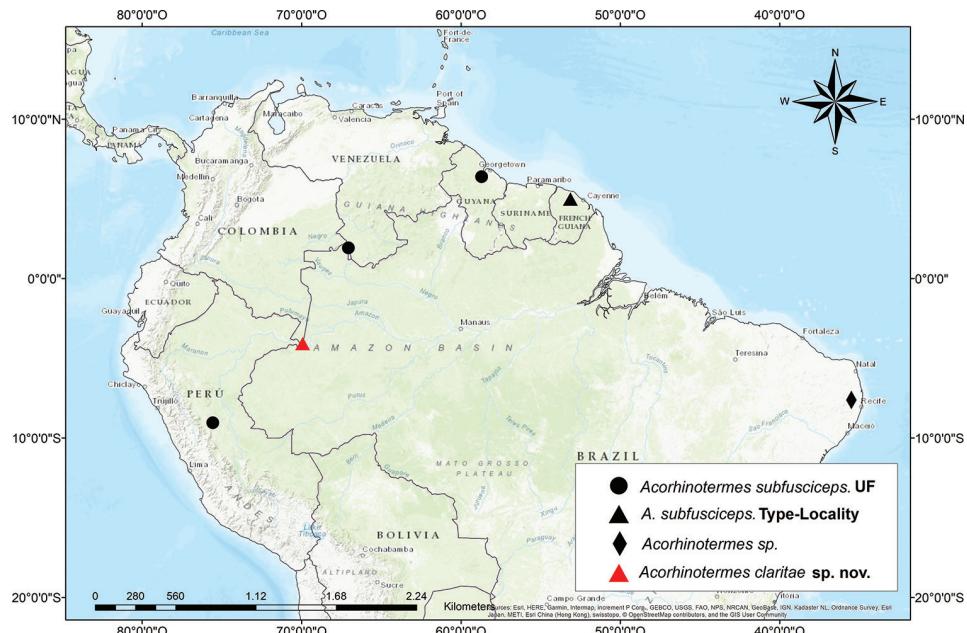

Figure 5. Distribution map of *Acorhinotermes* spp. Black circles are records from University of Florida termite collection and the black diamond is the record of Silva et al. (2019).

Discussion

In our Colombian survey, about 102 minor soldiers were collected without a single major soldier reinforces our belief that the latter caste is absent from *A. claritae* sp. nov. Among genera of the subfamily Rhinotermitinae, *Dolichorhinotermes* has been the most common in the Amazon region surveys, followed by *Rhinotermes* and then *Acorhinotermes* (Castro unpubl. data; Constantino 1991; de Souza and Brown 1994; Palin et al. 2011). However, *R. marginalis* is found in the West Indies while *D. longilabius* has not been reported from there, with the exception of the islands of Trinidad and Tobago where the latter species is common and the former has not been collected (Scheffrahn unpubl. data). *A. claritae* sp. nov. is the first record for the genus in Colombia.

In the key to genera of Neotropical termites, Constantino (2002) differentiated *Dolichorhinotermes* minor soldiers from *Rhinotermes* minor soldiers by the length of the head to the tip of the labrum, less than 1.2 mm, but *D. tenebrosus* and *D. lanciarius* measures greater than 1.2 mm. To differentiate these genera, the major soldier or imago caste is preferred. Major soldiers of *Dolichorhinotermes* have a narrow long labrum reaching near tips of mandibles while the major soldiers of *Rhinotermes* have a short wide labrum that extends no more than half the length of the mandibles when extended. Also, the known imagos of *Dolichorhinotermes* head width range is 1.18–1.29 mm while the *Rhinotermes* imago head width range is 1.90–2.18 mm.

Acknowledgments

A special thanks to James A. Chase for sponsoring the field trip. Thanks to Instituto Amazónico de Investigaciones Científicas SINCHI and to Dr. Clara Peña-Venegas for the logistics support to collect the material. We also thank to the survey team: James Chase, Daniela Manso and Lewis Pinedo. We heartily thank Dr. Mauricio Rocha, Dr. Carolina Cuezzo and anonymous reviewer for their useful comments and suggestions on the manuscript.
