Citation: Alberts CHE, Fisher EM (2022) A new species of *Saropogon* Loew, 1847 (Diptera, Asilidae) from Arizona, with a review of the Nearctic species north of Mexico. ZooKeys 1130: 1–63. <https://doi.org/10.3897/zookeys.1130.81874>

Abstract

The Nearctic species of *Saropogon* Loew, 1847 north of Mexico are reviewed, with 19 species recognized and one described as new: *Saropogon pyrodes* **sp. nov.** from Arizona. This previously recognized new species has awaited description since its first collection in 1964. Only after a community scientist posted photographs taken in nature to an online database did its description become a priority. All species of *Saropogon* occurring in the Nearctic Region north of the Mexican border have been reexamined. Photographs and diagnoses of all species are provided with a distribution map of the included specimens studied. An updated key to the Nearctic species north of Mexico is provided. Finally, the need for a review of the diverse Mexican fauna is expressed.

Keywords

Assassin flies, community science, identification key, Nearctic, robber flies, taxonomy

Introduction

New and undescribed species of insects are increasingly photographed and posted to online databases by the public (e.g., Mesaglio et al. 2021). Online images and identification databases are excellent resources through which community naturalists and scientists can interact with experts of their interest groups, sometimes resulting in the joint discovery of a new species (e.g., Winterton et al. 2012). Herein we describe a case where a known new species had been awaiting description in a personal collection for

many years, but it was not until images were posted online that the naming of the species became a priority. This charismatic and ‘fire-like’ species of assassin fly (Diptera: Asilidae; Fig. 1) has inspired the reexamination of the Nearctic species of the globally diverse and taxonomically confounding genus, *Saropogon* Loew, 1847.

Saropogon (Fig. 1) includes at least 128 species and two subspecies (Sakhvon 2020). It is one of few Asilidae genera believed to occur in almost all zoogeographic regions (Londt 1997; Sakhvon 2020; GBIF Secretariat 2021). It is, however, found mainly in temperate and tropical climates. In the Nearctic, *Saropogon* occurs primarily in the southwestern states within the USA, in Texas, Arizona, New Mexico, and California, with some species scattered in the adjacent states. Some species occur as far north as Colorado and Nebraska and as far south as Nayarit, Mexico (Fig. 2). This manuscript focuses on the species found in Arizona but provides locality information of all specimens examined in the Suppl. material 1.

Figure 1. *Saropogon pyrodes* sp. nov. male in nature at ~0.7 km ENE of Amado in southern Arizona on Sep. 5, 2017 (flicker: [<https://www.flickr.com/photos/7432824@N07/45297662671/in/album-72157687317436870/>]). Photograph by Jeff Gruber.

Wilcox (1966) most recently provided descriptions and an identification key to the then known Nearctic species. The status of several species has changed over the years, mainly due to the wide distribution and strong sexual dimorphism of many Nearctic species. We summarize the status history as follows:

- Loew (1847) described *Saropogon* as a subgenus of *Dasyopogon* (type species *Dasyopogon luctuosus* Wiedemann, 1820).

- Loew (1874) described the first Nearctic *Saropogon* species from Texas (*S. combustus* (male) and *S. adustus* (female)).
- Osten-Sacken (1887) described *Saropogon senex* from Mexico (Sinaloa).
- Coquillett (1902) described *Saropogon dispar* from Texas.
- Johnson (1903) described *Saropogon abbreviatus* and *S. bicolor* from Texas.
- Coquillett (1904) described *Saropogon semiustus*, *S. luteus*, and *S. hyalinus* from California.
- Back (1904) described *Saropogon albifrons* from Arizona and *S. rufus* from California.
- Back (1909) synonymized *Saropogon albifrons* with *S. semiustus* (in part, see Wilcox 1966: 131), synonymized *S. adustus* with *S. combustus*, synonymized *S. rufus* with *S. luteus*, and described *S. coquillettii* from New Mexico. He also gave descriptions and a key to the known Nearctic species.
- Curran (1930) described *Saropogon aridus* and *S. purus* from Arizona and published a key to the species.
- Curran (1931) described *Saropogon birdi* from Oklahoma and provided a revised key to the species.
- Bromley (1934) described *Saropogon fletcheri* and *S. pritchardi* from Texas and Oklahoma and gave a key to the Texas species.
- Wilcox (1936) described the female of *Saropogon aridus*.
- Bromley (1951) described *Saropogon laparoides* and *S. solus* from Texas.
- Martin and Wilcox (1965) found that *Saropogon aridus* from Arizona was a synonym of *S. senex* described from Sinaloa, Mexico. Included *Saropogon hypomelas* (*Diogmites*) in their catalog.
- Wilcox (1966) described *Saropogon bryanti* and *S. mohawki* from Arizona as well as *S. sculleni* and *S. nitidus* from Texas, noted of the synonymy of *S. albifrons* with *S. semiustus*, and discussed a personal communication with Bromley in 1936, who, after examining the type of *Diogmites hypomelas* decided that it belonged to *Saropogon* and Wilcox included the change in his identification key.
- Fisher and Wilcox (1997; unpublished) proposed that *Saropogon sculleni* was a junior synonym of *S. laparoides*.

Current North American species:

Saropogon abbreviatus Johnson, 1903

Saropogon albifrons Back, 1904

Saropogon birdi Curran, 1931

Saropogon bryanti Wilcox, 1966

Saropogon combustus Loew, 1874

Saropogon coquillettii Back, 1909

Saropogon dispar Coquillett, 1902

Saropogon fletcheri Bromley, 1934

Saropogon hyalinus Coquillett, 1904

Saropogon hypomelas Loew, 1866

Saropogon laparoides Bromley, 1951
Saropogon luteus Coquillett, 1904
Saropogon mohawki Wilcox, 1966
Saropogon nitidus Wilcox, 1966
Saropogon pritchardi Bromley, 1934
Saropogon purus Curran, 1930
Saropogon pyrodes sp. nov.
Saropogon semiustus Coquillett, 1904
Saropogon senex Osten Sacken, 1887
Saropogon solus Bromley, 1951

Materials and methods

This study is based on examined specimens from the following institutions and online resources:

ASUHC	The Hasbrouck Insect Collection, Arizona State University, Tempe, Arizona, U.S.A.;
BMEC	The Bohart Museum of Entomology, University of California Davis, Davis, California U.S.A.;
BugGuide	www.bugguide.net , (VanDyke 2021);
BYU	Brigham Young University, Provo, Utah, U.S.A.;
CASENT	California Academy of Sciences Entomology Collection, San Francisco, California U.S.A.;
Flickr	www.flickr.com ;
iNaturalist	www.inaturalist.org ;
LACMENT	Natural History Museum of Los Angeles County Entomology Collection, Los Angeles, California, U.S.A.;
MCZ	Museum of Comparative Zoology, Harvard University, Cambridge, Massachusetts, U.S.A.;
NHMLK	Natural History Museum, London, England, U.K.;
NMSU	New Mexico State University Arthropod Collection, Las Cruces, New Mexico, U.S.A.;
TAM	personal collection of Dr. Tristan McKnight, Tucson, Arizona U.S.A.;
SEMC	Snow Entomological Museum Collection, The University of Kansas, Lawrence, Kansas, U.S.A.;
TAMUIC	Texas A&M University Insect Collection, College Station, Texas, U.S.A.;
UAIC	The University of Arizona Insect Collection, Tucson, Arizona, U.S.A.;
UCR	University of California Riverside Entomology Research Museum, California, U.S.A.; and
USNM	Smithsonian National Museum of Natural History, Washington, D.C., U.S.A.

Figure 2. Distribution of Nearctic *Saropogon* (Diptera: Asilidae) examined. Red box indicates focused distribution for Fig. 26. Map created with SimpleMappr on 25 January 2022, and available at: <https://www.simplemappr.net/map/17061>.

Repository abbreviations are from the 2022 GBIF Registry of Scientific Collections with some additions of preferred names from the collection's website, or personal communications.

Morphological terminology follows Dikow (2009a) and Cumming and Wood (2017). In the descriptions, abdominal tergites are abbreviated with 'T,' and sternites are abbreviated with 'S.' Prothoracic, mesothoracic, and metathoracic segments are abbreviated to 'pro,' 'mes,' and 'met,' respectively. Pubescence refers to the short, fine microtrichia densely covering certain body parts. Other generalized terms follow Nichols (1989).

Species descriptions are based on all specimens examined (Suppl. material 1) and not exclusively on the holotype. A total of 1522 specimens of *Saropogon* was examined. The sole specimen of *S. birdi* Curran, 1931 was examined from photographs provided by the AMNH staff. The female wing of *Saropogon pyrodes* was not photographed because only two female specimens were available (the method used is destructive), and because there is no apparent sexual dimorphism present in this species.

Not all holotypes were examined in person. During the research portion of this manuscript, many collections were closed for visits and loans due to the Covid-19 pandemic and specimens were unavailable to the authors. All holotypes were at least examined through photographs. When available, links to all holotype photographs have been provided in the comments section for each species.

In all instances, specimens were dry-mounted on pins. Morphological features were examined using a Wild stereomicroscope. Wing length is measured from the tegula to the distal tip of the wing. Wing length is used in the species descriptions instead of body length because *Saropogon* abdomens are sometimes curved and difficult to measure. We have found more consistent measurements with wing lengths. The left wing was removed or, if previously broken, taken from the unit tray from a representative specimen from each species examined. After being photographed, the wing was then placed in a plastic pill capsule and pinned underneath the relevant specimen. The male terminalia were removed, placed in 10% potassium hydroxide (KOH) at 55 °C, neutralized in acetic acid (CH₃COOH) and rinsed in distilled water (H₂O). They were temporarily stored in 75% ethanol (C₂H₅OH) for further examination and illustration, eventually sealed in polyethylene vials containing 100% glycerin (C₃H₈O₃), and pinned underneath the corresponding specimen.

Most whole habitus photographs of pinned specimens and wings were taken at the BMEC by the first author, using a GIGAmacro Magnify² system, a Canon MP-E 65 mm macro-lens, Canon EOS Rebel T5i. The specimens were illuminated with a Macro Twin Lite MT-24EX through a simple paper light diffuser tube. The images were then processed through Lightroom and stacked using Zerene stacker. Finally, spot cleaning, color fixing, and inserting scale bars were done in Adobe Photoshop. At USNM, photographs appearing as Fig. 8A–G of the female and male terminalia were taken on a Zeiss SteREO Discovery V12 stereo microscope with a PlanApo S 1.0× lens at 40–95× magnification and an attached Olympus OM-D E-M1 MicroFourThirds digital camera. The dissected terminalia were placed in 75% ethanol in a glass dish and illuminated by a Schott VisiLED light source using mixed bright-field (dorsal), dark-field (lateral), and transillumination (ventral). The MicroFourThirds camera was teth-

ered to a laptop computer and controlled by Olympus Capture software (version 2.2.1), and the vertical movement for obtaining photographs for later image stacking was done manually using the fine drive. Some whole habitus photographs of pinned specimens in the USNM were taken with a GIGAmacro Magnify² system, a Canon EOS D5 Mark IV full-frame DSLR, a Canon MP-E 65 mm F/2.8 macro-lens and illuminated by a Canon ring-lite flash. Individual RAW-format images taken at USNM were stacked using HeliconFocus Pro (version 7+) and exported in Adobe DNG-format.

SimpleMappr was used to generate the distribution maps of all specimens with defined localities (Shorthouse 2010). All localities and elevation not stated explicitly on the original label were estimated using Google Earth Pro version 7.3.4.8248 (Google Earth Pro 2021) and noted as estimates in Suppl. material 1. Google Earth Pro uses digital elevation model (DEM) to calculate elevation.

Taxonomy

Saropogon Loew, 1847

Saropogon Loew, 1847: 439 (as subgenus of *Dasypogon*). Type species: *Dasypogon luctuosus* Wiedemann, 1820; Coquillett (1910: 603); by designation.

= *Sarapogon* Williston, 1889: 74; incorrect spelling.

= *Araiopogon* Carrera, 1949: 122; junior synonym. Type species: *Dasypogon gayi* Macquart, 1838: 37).

= *Lycomax* Hull, 1962: 278; as a subgenus of *Saropogon* Loew, 1847. Type species: *Saropogon flavofacialis* Hull, 1956: 133.

= *Oberon* Carrera & Papavero, 1962: 57; junior synonym. Type species: *Oberon velutinus* Carrera & Papavero, 1962: 58.

Subfamily. Dasypogoninae (Hull 1962; Papavero 1973; Artigas and Papavero 1988; Lehr 1988; Geller-Grimm 2004; Dikow 2009a; Cohen et al. 2021).

Tribe. Saropogonini (Hardy 1926; Martin and Papavero 1970; Dikow 2009a, 2009b, 2018).

Diagnosis. *Saropogon* has a stout and often twisted spur at the antero-ventral apex of the fore tibiae (Fig. 3A), the same as related genera in the subfamily Dasypogoninae. It differs from other Nearctic taxa such as *Diogmites* Loew and *Blepharepium* Rondani by having cell m_3 open (Fig. 3B), and an antennal stylus composed of a single element with an apical seta-like element positioned apically in a cavity on the stylus (Fig. 3C). However, some *S. pritchardi* have cell m_3 almost closed, but never stalked. *Saropogon* differs from *Lestomyia* Williston by having a mystax confined to the oral margin (Fig. 3D) and its face is slightly concave (Fig. 3E) when viewed laterally. Some species of *Lestomyia* have a mystax confined to the oral margin, which can be distinguished from *Saropogon* by having strong anterior (presutural) dorsocentral bristles (absent in *Saropogon* (Wilcox 1966)). *Cophura* can be distinguished from *Saropogon* by its fore tibial spur on the postero-ventral surface being thin, and sigmoid rather than stout, hooked and

Figure 3. *Saropogon nitidus* illustrating distinguishing characters of the genus **A** fore tibia with a distinct spur. **B** open m_3 cell on wing **C** antennal style **D** mystax of *S. nitidus* restricted to oral margin **E** face slightly concave. Scale bar: 2 mm.

on the antero-ventral surface (Dikow 2009a). *Cophura* also has a midtibia with a large, usually black, apical spine, which is absent in all *Saropogon* studied. Length 10–27 mm.

Sexual Dimorphism and wing variation in *Saropogon*. Back (1909) and Wilcox (1966) have called attention to many species of *Saropogon* that represent prime examples of sexual dimorphism. Species like *S. abbreviatus* (Fig. 4A, B), *S. combustus* (Fig. 4C, D), *S. purus* (Fig. 4E, F), and *S. senex* (Fig. 4G, H) have the male abdomen predominantly black, whereas the female abdomen is largely red. However, there can be color variation within these species. Curran (1931) reported a female *S. combustus* with a black

abdomen. Leg color is also sexually dimorphic in most Nearctic *Saropogon*, with male legs tending to be black and female legs mainly reddish. Exceptions occur: the male of *Saropogon purus* has reddish hind femora and middle femora, and the female of *S. senex* has mainly black legs except for reddish hind femora. Setal patterns can also be dimorphic: males have long, erect, or semierect hairs on the mesonotum, abdomen, and legs in *Saropogon bryanti*, *S. combustus*, *S. coquillettii*, *S. dispar*, *S. laparoides*, and *S. mohawki*. In the females of these species, these hairs are short, appressed, and inconspicuous.

Wilcox (1966) emphasized that the wings of many species of *Saropogon* contain diagnostic features. Wings of *Saropogon abbreviatus* (Fig. 5A, B), *S. bryanti* (Fig. 5C, D), *S. combustus* (Fig. 5E, F), *S. dispar* (Fig. 5G, H), *S. hypomelas* (Fig. 5I, J), *S. luteus* (Fig. 5K, L), *S. purus* (Fig. 5M, N), and *S. senex* (Fig. 5O, P) are sexually dimorphic: they are brown in males, yellowish in females. Species with brown wings in both sexes are *Saropogon senex*, *S. abbreviatus*, *S. purus*, and *S. pritchardi*; *S. luteus* and *S. pyrodes* sp. nov., have yellowish wings in both sexes.

Biology. Dasypogoninae and *Saropogon* apparently tend to prefer Hymenoptera prey (Lavigne 2016; Pollock 2021; Table 1). *S. combustus* and *S. pritchardi* show a particular interest in the workers of *Pogonomyrmex* harvester ants (Pollock 2021). There is currently only one record of *Saropogon* as prey to another genus of Asilidae in North America. Bromley (1934) recorded *Diogmites symmachus* Loew, 1872 feeding on *Saropogon dispar* in Texas.

Table 1. Adult *Saropogon* predation records in North America. Records gathered from Lavigne 2016 online database (specimens were not examined personally); Arizona State University, Hasbrouck Insect Collection (ASUHC); Bellamy 2002; Brigham Young University, Provo, Utah (BYU); University of California, Davis, The Bohart Museum of Entomology (BMEC); Bromley 1934; Hurd 1952; Hurd and Linsley 1975; New Mexico State University Arthropod collection (NMSU); Pollock 2021; Sweetman 1958; Texas A&M University insect collection (TAMUIC); Thorp 1973; University of Arizona Insect Collection (UAIC); University of California, Riverside, Entomology Research Collection (UCR), and the Smithsonian's National Museum of Natural History (USNM) pinned collection. Duplicate prey records for the same species are not included.

Saropogon females oviposit in soil with the aid of the acanthophorite spines (Fig. 25D) at the tip of their ovipositor (Londt and Dikow 2017). They use the spines to dig into the ground, to lay the eggs, and to sweep soil over the eggs after oviposition (Dennis and Lavigne 1975).

Key to species of North American *Saropogon*, modified from Wilcox (1966)

- 1 Apical scutellar macrosetae absent or short, shorter than ½ length of scutellum **2**
- Apical scutellar macrosetae present, as long or longer than length of scutellum **4**
- 2 Apical scutellar macrosetae absent; both sexes with reddish abdomen; wing length 8 mm (USA: Texas; Mexico: Tamaulipas) Fig. 30 ***S. solus* Bromley**
- Apical scutellar macrosetae present; male abdomen black, female abdomen reddish..... **3**
- 3 Discal scutellar setae developed as short macrosetae; anepisternum (except dorsally), katepisternum, proepimeron, and anepimeron non-pubescent with large, uniformly arranged circular depressions; male legs black, female legs red (USA: California, Texas; Mexico: Baja California, Tamaulipas) Fig. 6 ***S. abbreviatus* Johnson**
- Discal scutellar setae absent; anepisternum, katepisternum, proepimeron, and anepimeron with grayish pubescence, without uniformly arranged circular depressions; legs predominantly black, both sexes with metathoracic femora red (USA: Arizona; Mexico: Sinaloa, Sonora, Nayarit) Fig. 29 ***S. senex* Osten Sacken**
- 4 Wings hyaline, without microtrichia or sparse microtrichia apically with no or sometimes slight color staining..... **5**
- Wings infusate, males with brown or black wings, females paler but with staining and/or microtrichia concentrated apically and around veins; generally larger flies (except *S. purus* and *S. luteus*)..... **12**
- 5 Predominantly black abdomen; fore coxae with long, fine, white setae (USA: Texas) Fig. 16..... ***S. laparoides* Bromley**
- Predominantly reddish or yellowish abdomen; fore coxae with macrosetae or bare..... **6**
- 6 Anepisternum and katepisternum with non-pubescent spot on the anterior half (e.g., Fig. 19B, F)..... **7**
- Anepisternum and katepisternum pubescent throughout **8**

- 7 Red non-pubescent spot on anepisternum and katepisternum; femora reddish; antennae dark red to yellow; wings with slight microtrichia apically (USA: Arizona) Figs 22, 23–27..... ***S. pyrodes* sp. nov.**
- Black non-pubescent spot on anepisternum and katepisternum; femora yellowish; antennae black to brown; wings entirely bare of microtrichia (USA: New Mexico, Texas; Mexico: Chihuahua, Coahuila) Fig. 19..... ***S. nitidus* Wilcox**
- 8 White macrosetae on scutum and scutellum; scutellum with gray pubescence..... **9**

- Female with orange basal segments of the palpi, male with black; female abdomen with some black; male abdomen mostly black; four apical scutellar macrosetae (USA: Oklahoma, Texas) Fig. 12 ***S. dispar* Coquillett**
- 20 Male face and frons with white pubescence, female golden with ocellar tubercle and area around it white; male femur, sometimes tibia, black; female femur proximally black or with proximal black dorsal stripe, legs reddish; scutum with yellowish gray pubescence median stripe with brown pubescence without sub-lateral spots (USA: Arizona, New Mexico, Texas; Mexico: Coahuila, Nuevo Leon) Fig. 15 ***S. hypomelas* (Loew)**
- Both sexes face and frons with golden pubescence; femur in both sexes reddish with black dorsal stripe; scutum yellowish with broad central stripe and elongated sub-lateral spots with gray pubescence (USA: Arizona, New Mexico, Texas; Mexico: Sonora) Fig. 9 ***S. bryanti* Wilcox**

***Saropogon abbreviatus* Johnson, 1903**

Figs 4A, B, 5A, B, 6, 26, 31

Saropogon abbreviatus Johnson, 1903: 113.

Saropogon bicolor Johnson, 1903: 113, junior synonym [homonym of *Saropogon bicolor* Jaennicke, 1867 (currently recognized as *Diogmites bicolor* Jaennicke, 1867)].

References. Back 1909: 345 (key and redescription); Curran 1930: 2 (key), 1931: 2 (key); Martin and Wilcox 1965: 383 (catalog); Wilcox 1966: 128 (key); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. Has a rather short and stout abdomen with uniformly arranged circular depressions. The male is black with black or brown wings and the female is reddish with brown wings, darker apically. Body length 9–12 mm; wing length 7–9 mm. Flight time April – August.

Figure 4. Sexual color dimorphism **A** *Saropogon abbreviatus* female **B** *S. abbreviatus* male **C** *S. combustus* female **D** *S. combustus* male **E** *S. purus* female **F** *S. purus* male **G** *S. senex* female **H** *S. senex* male. Scale bars: 2 mm.

Most similar to *Saropogon senex* and *S. purus*. Differs from *S. purus* because *S. abbreviatus* has short apical scutellar macrosetae, whereas the apical scutellar macrosetae of *S. purus* are longer than the length of the scutellum. Differs from *S. senex* because *S. abbreviatus* has short discal scutellar macrosetae, and *S. senex* has none.

Figure 5. Representative *Saropogon* wings of **A** *S. abbreviatus* female **B** *S. abbreviatus* male **C** *S. bryanti* female **D** *S. bryanti* male **E** *S. combustus* female **F** *S. combustus* male **G** *S. dispar* female **H** *S. dispar* male **I** *S. hypomelas* female **J** *S. hypomelas* male **K** *S. luteus* female **L** *S. luteus* male **M** *S. purus* female **N** *S. purus* male, and **O** *S. senex* female **P** *S. senex* male. Scale bars: 2 mm.

Distribution. USA: California, Texas; Mexico: Baja California, Tamaulipas.

Type material examined. UNITED STATES OF AMERICA • 1 ♂, holotype; Texas; MCZ; Type 7582.

Other material examined. Suppl. material 1.

Comments. The holotypes of *Saropogon abbreviatus* and *S. bicolor* (jr. syn.) are currently in the Museum of Comparative Zoology at Harvard University. The collection pro-

***Saropogon albifrons* Back, 1904**

Figs 7, 26, 32

Saropogon albifrons Back, 1904: 29.

Saropogon semiustus Coquillett, 1904: 186, junior synonym. In part.

References. Martin and Wilcox 1965: 383 (catalog); Wilcox 1966: 130 (key and redescription); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. Legs reddish orange in both sexes; face, scutum, and anepisternum entirely with white pubescence with white macrosetae; antennae yellowish; ~ 30 macrosetae forming mystax; wings hyaline with a slightly darker tinge proximally; veins brownish at the base of the wing, darker apically; T2–5 postero-laterally with white pubescence in both sexes; scutellum with only two marginal bristles. Body length 9–14 mm; wing length 7–9 mm. Flight time April – June.

Easily confused with *Saropogon semiustus*, especially females; white face pubescence is the best distinguishing character in *S. albifrons*.

Distribution. USA: Arizona, California; Mexico: Baja California.

Type material examined. UNITED STATES OF AMERICA • 1 ♀, lectotype; Arizona, Mohave County, Bill Williams Fork; August; F. H. Snow; SEMC; SEMC1603972 • 1 ♀, paralectotype; same collection information as lectotype; SEMC; SEMC1603973.

Other material examined. Suppl. material 1.

Comments. *Saropogon albifrons* was not mentioned by Curran (1930, 1931), most likely because the species was not included in the Back (1909) identification key. [The authors are unsure as to why it was not included.] The co-types (syntypes) referenced in Back 1904 were deposited one in the Massachusetts Agricultural College collection and one at the University of Kansas collection (SEMC); however, both can be currently found at SEMC. The authors have designated the specimen in better condition to be the lectotype and the other the paralectotype. Information about them can be found here: <https://biodiversity.ku.edu/node/1095/>.

Saropogon birdi Curran, 1931

Figs 8, 26, 31

Saropogon birdi Curran, 1931: 2.

References. Curran 1931: 2 (key and original description); Martin and Wilcox 1965: 383 (catalog); Wilcox 1966: 129 (key to females); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. Antennae mostly reddish except the style; base of palpi are black; femora black dorsally; coxal macrosetae yellowish; wings amber-colored with a tinge of brown apically; two apical scutellar macrosetae; abdomen mostly black. Body length 27 mm; wing length 15–21 mm. Flight time June.

Commonly confused with *Saropogon pritchardi* but *S. birdi* has black on the femora dorsum. Distinguished from *S. dispar* by having two apical scutellar macrosetae, and black basal segments of the palpi. *S. dispar* has four apical scutellar macrosetae and the female has orange basal segments of the palpi.

Distribution. USA: Oklahoma.

Type material examined. UNITED STATES OF AMERICA • 1 ♀, holotype; Oklahoma, Johnson County; 34°17'N, 96°37'W; 241 m; 20 June 1929; R. D. Bird; AMNH.

Figure 8. *Saropogon birdi* Curran, 1931 Female holotype **A** anterior view **B** lateral view **C** dorsal view. Photograph provided by American Museum of Natural History.

Comments. We were only able to examine the holotype from images sent from the American Museum of Natural History where it is housed. We have been unable to find any other specimens of this species to examine.

***Saropogon bryanti* Wilcox, 1966**

Figs 5C, D, 9, 26, 33

Saropogon bryanti Wilcox, 1966: 132.

References. Wilcox 1966: 132 (key and original description); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. Femur in both sexes reddish with black dorsal stripe; male and female face and frons with golden pubescence; scutum yellowish with the broad central stripe and elongated sub-lateral spots with gray pubescence. Male wing covered in microtrichia, female wing with microtrichia especially around veins Body length 16–19 mm; wing length 16–18 mm. Flight time June – August.

Distinguishable from *Saropogon hypomelas* by the face and frons being with golden pubescence and the extent of the black on the femora.

Distribution. USA: Arizona, New Mexico, Texas; Mexico: Sonora.

F. Winburn, R. H. Painter; CASENT; [CASENT8427207](#).

Other material examined. Suppl. material 1.

Comments. One specimen we examined was from Iowa ([CASENT8427218](#), Suppl. material 1), though the species seems to be identified correctly, this is still an unusual occurrence and may be a mistake, so it is not included in the known distribution for this species. Photographs of the *Saropogon bryanti* holotype can be found at: <https://monarch.calacademy.org/taxa/index.php?tid=679454>.

Saropogon combustus Loew, 1874

Figs 4C, D, 5E, F, 10, 26, 34

Saropogon combustus Loew, 1874: 373.

Saropogon adustus Loew, 1874: 375, junior synonym.

References. Osten-Sacken 1874:185 (catalog); Back 1909: 347 (key and redescription); Curran 1930: 2 (key), 1931: 2 (key and notes); Martin and Wilcox 1965: 383 (catalog); Wilcox 1966: 129 (key); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. This species is sexually dimorphic: males mostly black, wings brown, four scutellar bristles; females reddish, wings yellowish, anterior corners of T2–5 black. Body length 13–19 mm; wing length 14–17 mm. Flight time May – October.

Figure 10. *Saropogon combustus* Loew, 1874 Female (USNMENT01819131): **A** dorsal view **B** lateral view **C** anterior view; Male (USNMENT01819138): **D** anterior view **E** dorsal view **F** lateral view. Scale bars: 2 mm.

The male is easily distinguished from *Saropogon fletcheri* and *S. pritchardi* because it is significantly darker and more robust than the other males. The female is a bit more challenging but can be separated from *S. fletcheri* because it does not have the black anterior bands on its abdomen. The female *S. pritchardi* also has significantly darker wings than *S. combustus* which is pale brown and darker apically.

Distribution. USA: Colorado, Kansas, Nebraska, New Mexico, Oklahoma, Texas, SimpleMappr: <https://www.simplemappr.net/map/16981>.

Type material examined. UNITED STATES OF AMERICA • 1 ♂, holotype; Loew; photographed pinned specimen; MCZ; Type 12819 • 1 ♀; Loew; MCZ; Type 12818.

Other material examined. Suppl. material 1.

Comments. The holotypes of both *Saropogon combustus* and *S. adustus* (junior synonym) are in the Museum of Comparative Zoology at Harvard University. The collection provides photos of the types on their website MCZBase: https://mczbase.mcz.harvard.edu/MediaSearch.cfm?action=search&media_id=99135,99136,99137,99138,99139 and https://mczbase.mcz.harvard.edu/MediaSearch.cfm?action=search&media_id=99130,99131,99132,99133,99134.

***Saropogon coquillettii* Back, 1909**

Saropogon coquilletti auctt: common misspelling.

References. Back 1909: 348 (original description and key); Curran 1930: 2 (key), 1931: 2 (key); Martin and Wilcox 1965: 383 (catalog); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. *Saropogon coquillettii* is similar to *S. semiustus*, *S. hyalinus*, and *S. luteus*, but can be separated from them because it has four scutellar bristles instead of two. It has nearly hyaline wings with only a tinge of color apically and is more slender than *Saropogon combustus* and *S. dispar*. Body and wing length 14–16 mm. Flight time May – October.

Distribution. USA: Arizona, New Mexico, Texas; Mexico: Sonora, SimpleMappr: <https://www.simplemappr.net/map/16982>.

Type material examined. UNITED STATES OF AMERICA • 1♂, holotype; New Mexico, Doña Ana County, Las Cruces; 32°28'N, 106°52'W; 1247 m; Aug 1923; Townsend; USNM; USNMMENT01199124 • 1♂, 1♀, topotype; same locality data as holotype; 28 Jul; Townsend; USNM; USNMMENT01199038, USNMMENT01199017.

Other material examined. Suppl. material 1.

Comments. This species is often misspelled (e.g., Curran 1930, 1931) as *Saropogon coquilletti*, but the original description states *S. coquillettii*. Photographs of the holotype can be viewed at: <http://n2t.net/ark:/65665/326f621b6-964b-4453-8fb5-715b5480ab6f>.

***Saropogon dispar* Coquillett, 1902**

Figs 5G, H, 12, 32

Saropogon dispar Coquillett, 1902: 139.

References. Back 1909: 349 (key and redescription); Curran 1930: 2 (key), 1931: 2 (key and notes); Martin and Wilcox 1965: 383 (catalog); Wilcox 1966: 129 (key); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. This species is sexually dimorphic: males with brown wings, black mesonotum and legs, brownish tibiae and tarsi; females with yellowish wings, brown mesonotum, reddish legs, distally blackish prothoracic and mesothoracic femora. Body length 20–23 mm; wing length 18–21 mm. Flight time May – August.

Figure 12. *Saropogon dispar* Coquillett, 1902 Female (UCBMEP0280509): **A** dorsal view **B** lateral view **C** anterior view; Male (UCBMEP0280508): **D** anterior view **E** dorsal view **F** lateral view. Scale bars: 2 mm.

Saropogon dispar may be confused with *S. hypomelas* or *S. bryanti* but it is a significantly darker species than either.

Distribution. USA: Oklahoma, Texas, SimpleMappr: <https://www.simplemappr.net/map/16983>.

Type material examined. UNITED STATES OF AMERICA • 1♂, holotype; Texas, DeWitt County, Cuero; 29°05'N, 97°17'W; 57 m; 06 Jun.; USNM; USNMMENT01199066

Other material examined. Suppl. material 1.

Comments. Bromley (1934) states “*Saropogon dispar* is by far the most noxious species in bee-yards in the San Antonio region.” See Table 1 for prey records. Access photographs of the holotype at <http://n2t.net/ark:/65665/33098b0bf-d97f-4b92-9141-eea52cd9f59a>.

Saropogon fletcheri Bromley, 1934

Figs 13, 26, 34

Saropogon fletcheri Bromley, 1934: 91.

References. Bromley 1934: 91 (original description); Martin and Wilcox 1965: 383 (catalog); Wilcox 1966: 130 (key); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. This species is sometimes similar to *Saropogon dispar* but both sexes are reddish and the femora lack black. Scutellum has four reddish bristles; and wings are pale reddish brown. Body length 24–17 mm; wing length 11–14 mm. Flight time April – October.

Distribution. USA: Arizona, Texas, SimpleMappr: <https://www.simplemappr.net/map/16984>.

Type material examined. UNITED STATES OF AMERICA • 1♂, holotype; Texas, Comfort; 29°58'N, 98°54'W; 19 July 1921; R. K. Fletcher; TAMUIC.

Arizona material examined. UNITED STATES OF AMERICA • 1♀; Maricopa County, Morales; 34°02'N, 111°05'W; 1496 m; 27 August 1913; W. D. Pierce; USNM; USNMMENT01819450.

Other material examined. Suppl. material 1.

Saropogon hyalinus Coquillett, 1904

Figs 14, 26, 32

Saropogon hyalinus Coquillett, 1904: 185.

References. Back 1909: 351 (key and short redescription); Curran 1930: 2 (key), 1931: 2 (key); Martin and Wilcox 1965: 383 (catalog); Wilcox 1966: 129 (key); Fisher and Wilcox 1997: 4 (catalog).

Figure 13. *Saropogon fletcheri* Bromley, 1934 Male (UCBMEP0280504): **A** anterior view **B** lateral view **C** dorsal view. Scale bars: 2 mm.

Diagnosis. This species is similar to *Saropogon luteus* except the wings are pure hyaline, and the scutum is densely with yellowish pubescence, with gray pubescent median stripe and elongated sub-lateral spots, crossing the transverse suture. Body length 13–17 mm; wing length 9–11 mm. Flight time May – September.

Distribution. USA: California, SimpleMappr: <https://www.simplemappr.net/map/16985>.

Type material examined. UNITED STATES OF AMERICA • 1 ♀, holotype; California, Los Angeles County; 34°03'N, 118°14'W; 97 m; Coquillet; USNM; USNMENT01199005.

Other material examined. Suppl. material 1.

Comments. You can access photographs of the holotype here: <http://n2t.net/ark:/65665/308595f92-7180-42d6-a5ed-8be56e3423d4>.

Figure 14. *Saropogon hyalinus* Coquillett, 1904 Female (USNMMENT01830078): **A** dorsal view **B** lateral view **C** anterior view; Male (UCBMEP0280500): **D** anterior view **E** dorsal view **F** lateral view. Scale bars: 2 mm.

***Saropogon hypomelas* (Loew, 1866)**

Figs 5I, J, 15, 26, 33

Diogmites hypomelas Loew, 1866: 24 [= *Saropogon hypomelas* (Loew)].

References. Loew 1866: 24 (as *Diogmites*); Martin and Wilcox 1965: 383 (catalog); Wilcox 1966: 133 (key and translation of original description); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. A large, sexually dimorphic species. Male with legs reddish, femur, sometimes tibia, black; face and frons with white pubescence; female femur proximally black or with proximal black dorsal stripe; face and frons with golden pubescence; both

Figure 15. *Saropogon hypomelas* Loew, 1866 Female (USNMENT01830080): **A** dorsal view **B** lateral view **C** anterior view; Male (UCBMEP0280599): **D** anterior view **E** dorsal view **F** lateral view. Scale bars: 2 mm.

sexes with scutum with yellowish-gray pubescence, median stripe with brown pubescence. Body length 17–27 mm; wing length 17–18 mm. Flight time April – September.

Distribution. USA: Arizona, New Mexico, Texas; Mexico: Coahuila, Nuevo Leon, SimpleMappr: <https://www.simplemappr.net/map/16986>.

Type material examined. UNITED STATES OF AMERICA • 1 ♀, syntype, New Mexico; 34°17'N, 106°17'W; Loew; MCZ; MCZ-ENT00012822.

Arizona material examined. UNITED STATES OF AMERICA • 1 ♀; Maricopa County, 3 mi. N. Gila Bend; 32°58'N, 112°42'W; 205 m; 27 July 1969; H. A. Smith; CASENT; CASENT8427317 • 1 ♀; Pima County, Madera Canyon; 31°43'N, 110°52'W; 1503 m; 14 July 1980; T. L. McKenzie; USNM; USNMENT01830394 • 1 ?; Pima County, Santa Rita Mtns. Madera Canyon; 31°43'N, 110°52'W; 1503 m; 13 September 1964; R. H. Crandall; LACM; LACMENT579085

Other material examined. Suppl. material 1.

Comments. Martin and Wilcox (1965) included the name *Saropogon hypomelas* in their catalog. They did not state it as a new change, and the author who first transferred *Diogmites hypomelas* to *Saropogon*, is still unknown. Wilcox (1966) mentions receiving correspondence from Bromley in 1936 saying that after examining the type, he believed that it belonged in *Saropogon* Loew.

The syntype can be viewed at MCZBase: <https://mczbase.mcz.harvard.edu/guid/MCZ:Ent:12822>. The syntypes were listed under the name *Deromyia hypomelas* but have since been changed to the current valid name.

iNaturalist lists a record of *Saropogon hypomelas* from Oklahoma (<https://www.inaturalist.org/observations/90489061>) This photographed specimen evidently is correctly identified and would extend the known range for this species.

***Saropogon laparoides* Bromley, 1951**

Figs 16, 26, 32

Saropogon laparoides Bromley, 1951: 14.

References. Martin and Wilcox 1965: 383 (catalog); Wilcox 1966 (junior synonym *S. sculleni* is described and keyed); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. A small, dark species with hyaline wings and white coxal bristles. Females with mostly reddish legs with the tips of the tibiae and tarsi blackish and scutum with gray pubescence; Male femora mostly reddish, prothoracic and mesothoracic femora black dorsally, tibiae and tarsi blackish and mesonotum with yellowish gray pubescence. Male terminalia with many black setae. Body length 12–16 mm; wing length 8–9 mm. Flight time July – August.

Distribution. USA: Texas, SimpleMappr: <https://www.simplemappr.net/map/16987>.

Type material examined. UNITED STATES OF AMERICA • 1 ♀, holotype; Texas, Presidio County, Presidio; 29°33'N, 104°22'W; 787 m; 04 Aug. 1929; AMNH • 1 ♀, paratype; Texas, Presidio County, Chinati Mtns; 29°54'N, 104°27'W; 1924 m; 04 Aug. 1924; E. R. Tinkham; USNM; USNMENT01819182

Other material examined. Suppl. material 1.

Comments. According to Bromley (1951), this species resembles an African Dasygongoninae genus, *Meolapharus* [sic] (= *Neolapharus*, junior synonym of the widespread genus *Pegesimallus* (Londt, 1980)).

***Saropogon luteus* Coquillett, 1904**

Figs 5K, L, 17, 26, 33

Saropogon luteus Coquillett, 1904: 185.

Saropogon rufus Back 1904: 290, junior synonym.

Figure 16. *Saropogon laparoides* Bromley, 1951 Female (USNMENT01819592): **A** dorsal view **B** lateral view **C** anterior view; Male (USNMENT01819567): **D** anterior view **E** dorsal view **F** lateral view. Scale bars: 2 mm.

References. Back 1909: 351 (key and redescription); Curran 1930: 2 (key); Curran 1931: 2 (key); Martin and Wilcox 1965: 383 (catalog); Wilcox 1966: 130 (key); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. This species is the most likely one to be confused with *Saropogon pyrodes* sp. nov. because of its reddish color. They are easily distinguished by the entire anepisternum of *Saropogon luteus* being with gold pubescence instead of white as in *S. pyrodes* sp. nov. *Saropogon luteus* also has small, with gray pubescent spots on the posterior corners of the tergites. This species is almost exclusively found in California. Body length 11–17 mm; wing length 8–10 mm. Flight time May – September.

Figure 17. *Saropogon luteus* Coquillett, 1904 Female (UCBMEP0073792): **A** dorsal view **B** lateral view **C** anterior view; Male (UCBMEP0073760): **D** anterior view **E** dorsal view **F** lateral view. Scale bars: 2 mm.

Distribution. USA: California; Mexico: Baja California SimpleMappr: <https://www.simplemappr.net/map/16988>.

Type material examined. UNITED STATES OF AMERICA • 1 ♀, holotype; California, Los Angeles County; 34°03'N, 118°14'W; 97 m; Coquillett; USNM; USNMENT01199100.

Other material examined. Suppl. material 1.

Comments. Photographs of the holotype are available here: <http://n2t.net/ark:/65665/338f15b33-0872-416f-8a58-277c87bb8142>. The holotype of *Saropogon rufus* (junior synonym to *S. luteus*) is in the Museum of Comparative Zoology at Harvard University. Photographs of this specimen are available here: <https://mczbase.mcz.harvard.edu/guid/MCZ:Ent:7583>.

***Saropogon mohawki* Wilcox, 1966**

Figs 18, 26, 34

Saropogon mohawki Wilcox, 1966: 134.

References. Wilcox 1966: 134 (key and original description); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. Wings completely hyaline, the posterior corners of T2–4 with gray pubescence, the anterior corners of T4 and 5 (sometimes T4–6) with black spots; legs pale-colored in both sexes but sometimes femora blackish basally in male. This species is mostly easily confused with *Saropogon coquillettii*; the main differences are the extent

Figure 18. *Saropogon mohawki* Wilcox, 1966 Female paratype (UCBMEP0003173): **A** dorsal view **B** lateral view **C** anterior view; Male (UCBMEP0003175): **D** anterior view **E** dorsal view **F** lateral view. Scale bars: 2 mm.

of abdominal markings and the lack of wing microtrichia. Body length 10–13 mm; wing length 11–15 mm. Flight time May – October.

Distribution. USA: Arizona, California, Nevada, Utah; Mexico: Baja California, Sonora, SimpleMappr: <https://www.simplemappr.net/map/16989>.

***Saropogon nitidus* Wilcox, 1966**

Figs 19, 31

Saropogon nitidus Wilcox, 1966: 135.

References. Wilcox 1966: 135 (key and original description); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. This species can be easily distinguished from others in the region by a shining black non-pubescent spot on the anterior half of the anepisternum and katepis-

Figure 19. *Saropogon nitidus* Wilcox, 1966 Female (USNMENT01830081): **A** dorsal view **B** lateral view **C** anterior view; Male (UCBMEP0280497): **D** anterior view **E** dorsal view **F** lateral view. Scale bars: 2 mm.

ternum. The male has yellowish red femora with black tibiae and tarsi; the posterior corners of T2–5 (males) and T2–4 (females) are with white pubescence; legs in female are yellowish. Body length 12–14 mm; wing length 8–10 mm. Flight time May – October.

Distribution. USA: New Mexico, Texas; Mexico: Chihuahua, Coahuila, SimpleMappr: <https://www.simplemappr.net/map/16990>.

Type material examined. UNITED STATES OF AMERICA • 1 ♂, holotype; Texas, Brewster County, Lajitas; 29°15'N, 103°46'W; 714 m; 04 Sep 1961; J. E. Gillaspay; CASENT; Type No. 9280.

Other material examined. Suppl. material 1.

Comments. Photographs of holotype can be found at: <https://monarch.calacademy.org/taxa/index.php?tid=679457>.

Saropogon pritchardi Bromley, 1934

Figs 20, 33

Saropogon pritchardi Bromley, 1934: 90.

References. Martin and Wilcox 1965: 383 (catalog); Wilcox 1966: 129 (key); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. This is a large species but slightly smaller and more slender than *Saropogon dispar*. The wings are proportionately longer and broader than those of *S. dispar* and the legs are uniformly reddish without any dark markings. Wings and abdomen are black, the thorax with yellowish pubescence, and scutellum has two pale-colored bristles. Body length 20–23 mm; wing length 16–18 mm. Flight time July.

Distribution. USA: New Mexico, Oklahoma, Texas, SimpleMappr: <https://www.simplemappr.net/map/16991>.

Type material examined. UNITED STATES OF AMERICA • 1 ♂, holotype; Texas, Mills County; 20 July 1931; R. H. Painter; SEMC; SEMC1603974 • 1 ♂, 1 ♀, metatype; Oklahoma, Cimarron County, Boise City; 36°43'N, 102°30'W; 1271 m; 10 Jul 1933; A. E. Pritchard; USNM; USNMENT01819137, USNMENT01819532.

Other material examined. Suppl. material 1.

Comments. The holotype is housed at SEMC and information about it can be found here: <https://biodiversity.ku.edu/node/1095/>.

Saropogon purus Curran, 1930

Figs 4E, F, 5M, N, 21, 26, 33

Saropogon purus Curran, 1930: 3.

References. Curran 1930 (key and original description); Curran 1931: 2 (key); Martin and Wilcox 1965: 383 (catalog); Wilcox 1966: 129 (key); Fisher and Wilcox 1997: 4 (catalog).

Figure 20. *Saropogon pritchardi* Bromley, 1934 Female (UCBMEP0280596): **A** dorsal view **B** lateral view **C** anterior view; Male (UCBMEP0280595): **D** anterior view **E** dorsal view **F** lateral view. Scale bars: 2 mm.

Diagnosis. The broad, brown wings easily distinguish this species from others (Fig. 5). It is a sexually dimorphic species (Fig. 4). Male abdomen and legs are black, metathoracic femora in part reddish; female abdomen and legs are mostly yellowish red, coxae densely deep with golden pubescence. Body length 11–13 mm; wing length 7–9 mm. Flight time July to August.

Distribution. USA: Arizona; Mexico: Sinaloa, Sonora, SimpleMappr: <https://www.simplemappr.net/map/16992>.

Type material examined. UNITED STATES OF AMERICA • 1 ♂, holotype; Arizona, Pima County, Kits Peak Rincon, Baboquivari Mts.; 31°57'N, 111°33'W; 1234 m; 1–4 August 1916; F. E. Lutz; AMNH • 1 ♀, allotype; same collection data as holotype; AMNH.

Other material examined. Suppl. material 1.

Comments. Most specimens have two scutellar bristles, but Wilcox (1966) noted that some have four.

Saropogon pyrodes sp. nov.

<https://zoobank.org/3B057DFB-5B32-445D-AE22-037E7FD4C0C8>

Figs 1, 22, 23, 24, 25, 26, 27, 34

Diagnosis. The species is distinguished from congeners by its deep red color, hyaline wings, gracile body, white pubescence on the posterior margin of T1–7, and T3 is typically darker than the other tergites (Fig. 1).

Description. Male. Holotype (Figs 22, 23D–F).

Head. (Fig. 23) Wider than high; vertex slightly depressed (less than 60° angle on median margin of compound eye); facial swelling not developed and with gold pubescence; mystax 24 white macrosetae that are restricted to lower facial margin; ommatidia of different sizes, at least some median ommatidia distinctly larger; postgena with its posterior margin simple and smooth; frons with gray pubescence, white setose; ocellar tubercle with gray pubescence, with white setae and macrosetae; vertex with gray pubescence and white setae; median occiput sclerite with several white macrosetae; postocular setae slightly angled anteriorly distally, with white macrosetae; occiput predominately with gray pubescence and white setae; postocciput non-pubescent, with white and brown macrosetae.

Figure 22. Habitus drawing of male *Saropogon pyrodes* sp. nov. by Keely Davies.

Proboscis and maxillary palpus. (Fig. 23) Proboscis straight, subequal in length to an eye when viewed from the front, pale brown to dark brown distally; postmentum with white setae ventrally; prementum with white setae proximo-ventrally; labella reduced, apex blunt; maxillary palpus pale brown to orange, with yellow setae and macrosetae, non-pubescent.

Antenna. (Fig. 23) Pale brown to dark brown distally, with pale gray pubescence; scape approximately as long as pedicel, short white setae dorsally and long white macrosetae ventrally; pedicel white and pale brown setae distally; postpedicel tapering distally, medially broadest, short, approximately the same length as scape and pedicel combined, asetose; stylus composed of one element, asetose, with an apical seta-like sensory element in cavity of stylus.

Thorax. (Fig. 23) Pale brown to orange, with white pubescence; proepisternum with gray pubescence, with white setae and macrosetae; cervical sclerite long, with white setae; antepronotum with white pubescence, with white setae and macrosetae; postpronotum with white pubescence, with white setae; postpronotal lobe setose; pleuron with white pubescence; proepimeron asetose; anepisternum asetose; anepisternum supero-posterior asetose; anterior basallare asetose, with white pubescence; posterior basallare asetose, with white pubescence; anepimeron asetose, anterior half with white pubescence, posterior half non-pubescent; katapisternum asetose, anterior half non-pubescent, posterior half with white pubescence; katepimeron asetose, non-pubescent; katergite with white setae and macrosetae, with white pubescence; meron and metanepisternum asetose, with white pubescence; metakatepisternum asetose, with white

Figure 23. *Saropogon pyrodes* sp. nov. paratype female: **A** dorsal view **B** lateral view **C** anterior view; holotype male: **D** anterior view **E** dorsal view **F** lateral view. Scale bars: 2 mm.

pubescence; metepimeron asetose, and with white pubescence; anatergite asetose, with white pubescence; scutum predominantly with gray pubescence; scutum brown with white setae and macrosetae; scutal setae with small sockets; two notopleural setae; one supraalar seta; one postalar seta; many (> 4) short white dorsocentral (dc) setae; many (> 4) short white acrostichal setae; many (> 4) short white medial setae on posterior scutum (between dc setae); scutellum with gray pubescence; discal scutellar setae absent; apical scutellar setae present, two long brown macrosetae.

Leg. (Fig. 23) Pale brown to orange, non-pubescent, at least some setae dorso-ventrally flattened, others circular; coxae orange, with gray pubescence, with white setae and macrosetae; prothoracic femur flattened with white setae ventrally and long white setae dorsally; prothoracic tibia with short white setae except the antero-ventral

surface has short gold setae, one or two yellow macroseta on distal end of ventral side, with white macrosetae: four in a postero-dorsal row, five short ones in a postero-ventral row, one or two long macrosetae in a postero-ventral row; prothoracic tibia with sigmoid spur, originating antero-ventrally directly from tibia; mesothoracic coxa with gray pubescence, with white setae and macrosetae; mesothoracic femur ventrally asetose except for two white macrosetae on proximal end, short white macrosetae sparsely covering the rest; mesothoracic tibia with short white setae, white macrosetae: three in an antero-dorsal row, 2 in 1 antero-ventral row, four in a dorsal row, three in a postero-ventral row; metathoracic coxa with gray pubescence, with white setae and macrosetae; metathoracic femur with long white setae and macrosetae; metathoracic tibia with white macrosetae: three in a antero-dorsal row, three in an antero-ventral row, three in a dorsal row, three in a postero-ventral row, straight; tarsus with proximal pro, mes, and met tarsomeres as long as following two tarsomeres combined, with brown macrosetae; pulvilli well-developed (as long as claw); claw smoothly arched distally, pointed; empodium setiform, and well developed (as long as pulvilli).

Wing. (Fig. 24) 8 mm. Hyaline, without microtrichia; posterior wing margin with microtrichia arranged in a single plane.

Abdomen. (Figs 6, 25) Pale brown to orange with some tergites brown dorsally; tergite sculpture smooth and setae with small sockets only; T1 white setose, laterally with long white macrosetae, predominantly with gray pubescence, medially non-pubescent, entirely sclerotized medially, dorsal surface smooth and without protuberances; T2–8 entirely sclerotized, white setose, setae short medially and longer laterally, predominantly pale brown to orange, predominantly non-pubescent with gray pubescent band on posterior margin, band thinner dorso-medially; T2–8 marginal and medial macrosetae absent; S1–8 brownish orange, with short white setae, and with pale gray pubescence.

Male abdomen. (Fig. 25A–C) S8 simple, reduced rectangular sclerite; hypopygium rotated $\sim 90^\circ$ and pointing posteriorly; epandrium separated medially, joining proximally, and unfused; hypandrium well-developed and rectangular; hypandrium and epandrium approximating laterally, but not fused proximally; hypandrium and

Figure 24. *Saropogon pyrodes* sp. nov. wing. Scale bar: 2 mm.

Figure 25. *Saropogon pyrodes* sp. nov. terminalia. Male (USNMENT01819155): **A** dorsal view 75× **B** lateral view 75× **C** ventral view 75×; female (UAIC1128818): **D** dorsal view 80×, arrow indicating acanthophorites (spines) **E** lateral view 95× **F** ventral view of T6–9 40×, arrow indicating spiral spermathecal reservoir **G** ventral view of T8–9 80×, arrow indicating “X” shaped furca. Scale bars: 1 mm.

gonocoxites entirely free; gonocoxal apodeme present and short; gonostyli present and positioned distally on gonocoxites; cerci free and not fused medially; lateral ejaculatory process present and with a large cylindrical sclerite; one functional phallic prong; hypandrium with posterior margin simple with no distinct projections; sperm sac appearing weakly sclerotized; ejaculatory apodeme is a single plate.

Female abdomen. (Fig. 25D–G) S7 and T7 are normally developed, without any modifications; segments eight and following comprising ovipositor; setae on T8 are directed anteriorly; T8 with anterior rectangular apodeme and entirely fused to T8; S8 plate-like with hypogynial valves extending; T9 and T10 partly fused; T10 divided into two heavily sclerotized acanthophorite plates with eight acanthophorite spurs on each plate; three equally large spermathecae, common spermathecal duct short, and not extending beyond tip of furca, individual spermathecal ducts long; spermathecal reservoir formed by coiled ducts and heavily sclerotized spermathecae contained within three most posterior segments; furca divided anteriorly into two lateral sclerites, H-shaped; furcal apodeme present, short and platelike.

Length. Body length 10 mm; wing length: 6 mm.

Holotype condition. The holotype is in good condition and is not missing any parts.

Type material. UNITED STATES OF AMERICA • 1♂, holotype; Arizona, Pima County, 7 mi. N. Tucson; 33°47'N, 111°34'W; 740 m; 04 Sep. 1968; D. R. Miller, J. E. Biology. Jeff Gruber photographed specimens of *Saropogon pyrodes* sp. nov. and its habitat (Fig. 27A, B). *S. pyrodes* sp. nov. is seen here perching/hunting on a grass, most likely *Bouteloua aristidoides* (Poaceae; Fig. 27C), on the edge of a sandy clearing as well as consuming its prey (Fig. 27D) in the typical hanging position observed in other Dasypogoninae species.

Jeff Gruber described some behavior (Figs 1, 27) on Flickr: “Found this beauty as I was walking back to my car mid-afternoon on a very warm day. It was hanging around the low grasses at the periphery of a *Pogonomyrmex* ant nest in grassland type habitat on floodplain(?) of Santa Cruz River, which at the time was a dry wash. It alternated perches between the low grasses, short dead stems poking up from the

soil, and the soil surface”. Original post: <https://www.flickr.com/photos/7432824@N07/36417103883/in/faves-157063159@N04/>.

Etymology. Named for the fly’s bright, fiery red color; *pyrodes* is Greek for fire-like.

Comments. In 1964, Mike Irwin collected the first record of this species, a male from four miles north of Continental, Arizona. He gave the specimen to Joseph Wilcox to identify. Then in 1968, Miller collected twelve specimens (11 ♂ and 1 ♀) from just north of Tucson, Arizona. He also donated this collection to J. Wilcox. The second author borrowed the specimens from Wilcox in approximately 1979 when he started a Ph.D. program at the University of California, Riverside. He considered describing this unique fly but never did. Finally, in 2017, beautiful photographs by Jeff Gruber (Fig. 27A–D) of this species appeared on BugGuide (<https://bugguide.net/node/view/1439519>), an online community where naturalists post and identify images of arthropods from the United States and Canada. Because of this, the second author immediately knew that this fly was long overdue for description, resulting in this manuscript.

Saropogon bryanti and *S. senex* have been collected within 10 km of the type locality of *S. pyrodes*. *Saropogon purus* and *S. coquillettii* can also be found in the area; the material examined showed specimens within 60 km of *S. pyrodes* collection sites. *Saropogon hypomelas*, *S. fletcheri*, *S. albifrons*, and *S. mohawki* are all found within

200 km (Fig. 26). *Saropogon pyrodes* typically flies later in the season (Aug. – Sep.) than *S. bryanti* and *S. senex* (Jun. – Aug.), *S. purus* (Jul.), and *S. albifrons* (Apr. – Jun.). *Saropogon coquillettii* (May – Sep.), *S. fletcheri* and *S. mohawki* (Jun – Oct.), and *S. hypomelas* (Jun. – Sep.) have longer flight seasons but are uncommon in the later months.

***Saropogon semiustus* Coquillett, 1904**

Figs 26, 28, 31

Saropogon semiustus Coquillett, 1904: 186.

References. Back 1909: 351 (key and redescription); Curran 1930: 2 (key); Curran 1931: 2 (key); Martin and Wilcox 1965: 383 (catalog); Wilcox 1966: 130 (key and comments); Fisher and Wilcox 1997: 4 (catalog).

Diagnosis. This species most closely resembles *Saropogon hyalinus* and *S. albifrons* but can be easily separated by its smaller size and dense grayish pubescence on the face, thorax, scutellum, and coxae. Abdomen mostly polished with sides of T1 and a spot on the posterior corner of T2–5, with gray pubescence (sometimes absent in males). Legs in male black, except red at tips of femora; legs in female are reddish. Antennae are yellowish brown. Wings hyaline. Body length 8–10 mm; wing length 7–8 mm. Flight time April – June.

Distribution. USA: Arizona, California; Mexico: Sonora, SimpleMappr: <https://www.simplemappr.net/map/16994>.

Saropogon solus Bromley, 1951: 15.

References. Martin and Wilcox 1965: 383 (catalog); Wilcox, 1966: 128 (key); Fisher and Wilcox 1997: 4 (catalog).

Figure 30. *Saropogon solus* Bromley, 1951 Female (USNMENT01819178): **A** dorsal view **B** lateral view **C** anterior view; Male (USNMENT01819132): **D** anterior view **E** dorsal view **F** lateral view. Scale bars 2 mm.

Diagnosis. This species is distinguishable from all other North American species by its lack of apical scutellar bristles. Wings are yellow tinged with gray tips; legs are reddish yellow. Body length 12 mm; wing length 8 mm. Flight time June – Aug.

Distribution. USA: Texas; Mexico: Tamaulipas, SimpleMappr: <https://www.simplemappr.net/map/16996>.

Type material examined. UNITED STATES OF AMERICA • 1 ♂, holotype; Texas, Hildago County; 26°27'N, 98°13'W; 39 m; 16 Jun 1933; S. W. Bromley; USNM; USNMENT01199013.

Other material examined. Suppl. material 1.

Comments. Photographs of the holotype are available at; <http://n2t.net/ark:/65665/320c061d2-3a39-4baf-9836-909bdf168a64>.

Discussion

The description of the unique species *Saropogon pyrodes* sp. nov., with the summary of our knowledge of the Nearctic *Saropogon* north of Mexico in the present study is an initial contribution to understanding the diversity of this genus. A future, more detailed revision of all Nearctic species including those occurring in Mexico, would be a natural extension of this project. Multiple new species from Sinaloa, Sonora, Durango, and Jalisco have been accumulating in the collection of the second author (recently donated to the USNM). Combined with specimens housed in Mexican natural history collections, these will provide the foundation for a comprehensive revision of the entire Nearctic fauna. With the description of *Saropogon pyrodes* sp. nov. there are now 20 species known from the USA, and *Saropogon* is now the third most speciose genus of Dasypogoninae after *Cophura* Osten Sacken (~ 34 spp.) and *Diogmites* Loew with (~ 25 spp.) in the Nearctic north of Mexico (see Fisher and Wilcox 1997). In terms of the entire Asilidae fauna of the Nearctic, *Saropogon* is the 14th most species-rich genus (Fisher and Wilcox 1997; Geller-Grimm 2004).

There are a few morphological characters not previously mentioned that may prove useful for future species diagnosis and delimitation. The most apparent are the pubescence patterns on the dorso-median occiput (part or all of the median occipital sclerite). Of the species examined, *Saropogon albifrons*, *S. bryanti*, *S. coquillettii*, and *S. dispar* have minimal to no patterning with solid pubescence. *Saropogon hyalinus*, *S. luteus*, *S. mohawki*, *S. nitidus*, *S. purus*, *S. semiustus*, *S. senex*, and *S. pyrodes* sp. nov. have two non-pubescent spots directly adjacent to slightly posterior to, the ocellar tubercle. Particularly distinct patterns occur in *Saropogon mohawki* where the cuticle showing through the two non-pubescent spots is pale brown instead of black as in the other species examined; *S. purus* has one large non-pubescent spot behind the ocellar tubercle, and *S. pyrodes* sp. nov. has two non-pubescent spots, but they appear much rounder and larger than in the other material examined. These are far from concrete descriptions, but it shows further observation may be warranted. Another character we would like to reexamine in future studies is the dependence on the number of apical scutellar setae in the identification of *Saropogon*. This character has been heavily relied upon in past identification keys despite it being known for being inconsistent within species. Our key attempts to replace this character with other more dependable characters and only rely on apical scutellar setae where necessary (e.g., *S. mohawki* and *S. hyalinus*).

Platforms like iNaturalist and BugGuide have greatly facilitated communication between community and professional entomologists. *Saropogon pyrodes* sp. nov. is an excellent example of how community involvement can assist in the discovery and, ultimately, the description of new species. These community-based websites are a relatively new resource that scientists are learning to utilize in their research, and we hope to encourage future participation on both sides of the professional plane.

Figure 31. Distribution of *Saropogon* (Diptera: Asilidae) specimens studied for *S. abbreviatus*, *S. birdi*, *S. nitidus*, *S. semiustus*, and *S. solus*. Map created with SimpleMappr on July 25, 2022, and available at: <https://www.simplemappr.net/map/18363>.

Figure 32. Distribution of *Sarpogon* (Diptera: Asilidae) specimens studied for *S. albifrons*, *S. coquillettii*, *S. dispar*, *S. hyalinus*, and *S. laparoides*. Map created with SimpleMappr on July 25, 2022, and available at: <https://www.simplmappr.net/map/18317>.

Figure 34. Distribution of *Saropogon* (Diptera: Asilidae) specimens studied for *S. combustus*, *S. fletcheri*, *S. mohawki*, *S. pyrodes* sp. nov., and *S. senex*. Map created with SimpleMappr on July 25, 2022, and available at: <https://www.simplemappr.net/map/18362>.

Acknowledgements

First, we would like to thank the community scientists who helped inspire us to make this publication a priority, especially Jeff Gruber and Charles W. Melton for posting photographs of the new species to BugGuide, Flickr, and iNaturalist. We would like to thank Chris Grinter for allowing the first author to visit the CASENT collection, Helen Vessels for access to the NMSU Arthropod Collection, and Karen Wright for help visiting TAMUIC and photographs of *S. fletcheri*. We would like to thank Torsten Dikow with his help editing the manuscript, imaging resources, and access to USNM specimens, and Lynn Kimsey for access to BMEC, workspace, and imaging resources. We would like to thank Shawn Clark and Riley Nelson for loaning specimens from the BYU collection, and Gene Hall, Tristan McKnight, and Wendy Moore for allowing access to the collection and loaning specimens from UAIC. We would like to thank Melissa Aja for giving us access to photographs of *Saropogon combustus*, *S. rufus* (*luteus*), *S. abbreviatus*, *S. adustus* (*combustus*) and *S. bicolor* (*abbreviatus*) holotypes at the MCZ, Zachary Falin for photographs of *S. albifrons* and *S. pritchardi* holotypes from the SEMC collection, David Grimaldi, Christine Johnson, Agnieszka Pierwola, and Courtney Richenbacher for sending photographs of *S. birdi*, *S. laparoides*, and *S. purus* holotypes at the AMNH, Erica McAlister and Nigel Wyatt for photographs of the *S. senex* holotype from the NHMUK collection, and Nicole Gunter for taking and sending pictures of a very confusing Ohio *Saropogon*, which turned out to be *Diogmites*. We would like to thank Ellen Dean for help with habitat and plant identification, Emma Cluff for help with databasing and organizing specimens, Brennen Dyer for help taking pictures using the complicated GIGAmacro imaging system and tracking down elusive specimens, and Jessica Gillung for helping organize the manuscript. A special thanks to Keely Davies for making an incredible illustration of this *S. pyrodes* sp. nov., and Martin Hauser and the reviewers for giving us great advice on how to improve this manuscript. Finally, we would like to thank George Alberts and family for their love and support while the first author chased flies around the world. The authors have no funding to report and have declared that no competing interest exist.

Supplementary material I

Locality information of all specimens examined

Authors: Charlotte H. E. Alberts, Eric M. Fisher

Data type: excel file

Explanation note: Locality information of all specimens examined.
