Citation: Kahanpää J (2014) Checklist of the Diptera (Insecta) of Finland: an introduction and a summary of results. In: Kahanpää J, Salmela J (Eds) Checklist of the Diptera of Finland. ZooKeys 441: 1–20. doi: [10.3897/zookeys.441.7620](https://doi.org/10.3897/zookeys.441.7620)

Abstract

Nearly thirty-five years have passed since Hackman published his “Check list of the Finnish Diptera” (1980). The number of true flies (Diptera) known from Finland has increased by more than two thousand species since then. At the same time, hundreds of erroneous records have been recognized and purged from the checklist.

ZooKeys issue 441 provides a new checklist of the Diptera species of the Republic of Finland. This introductory paper presents the rationale behind the project, provides technical documentation on the checklist format and sources used, and summarizes the results. The remaining papers in this issue cover one or more Diptera families in detail.

Two electronic appendices are provided: supporting data (additional references to first published records and the previous checklist) and a complete list of Finnish Diptera taxa in Darwin Core compliant format for easy computer access and processing.

The new checklist records 6920 fly species from Finland, 2932 belonging to the nematoceran or lower flies and 3989 to the suborder Brachycera. The changes since 1980 are most prominent in the Lower Diptera. For example, more than 400 non-biting midges (Chironomidae) have been added since 1980, and the number of moth flies (Psychodidae) known from Finland has more than tripled. Among the larger families, large increases in known Finnish species are also seen in Cecidomyiidae (161% increase), Pipunculidae (98%), and Chironomidae (90%).

Keywords

Finland, Diptera, flies, biodiversity, faunistics

Introduction

The Diptera is a large order of holometabolous insects commonly known as flies and midges. With some 150,000 described extant species (Pape et al. 2011) and many more still undescribed, the Diptera is one of the most successful groups of animals by any measure. Flies and midges are also an important part of food webs in most land and freshwater ecosystems, particularly so in the arctic and alpine zones (Mani 1968, Pape 2009a). The economic relevance of flies is also considerable (see Pape 2009b for a recent summary): they are key pollinators and biological control agents, but also – less beneficially – important vectors of human and domestic animal diseases.

Why a new checklist?

The history of Finnish Diptera catalogs starts with Evert J. Bonsdorff (1861, 1866), who reviewed a part of the brachyceran fauna known from the country at the time, totaling 657 species. Systematic maintenance and publishing of faunistic data began with the start of Wolter Hellén's amazing series of summary papers covering new country records (and deletions) of all Insecta and running uninterrupted for six decades (Hellén 1922, 1926, 1931, 1936, 1941, 1946, 1952, 1956, 1961, 1966, 1971, 1976). Richard Frey, Lauri Tiensuu, and Ragnar Storå (1941) published the first complete list of Diptera recorded from Finland. It included 3824 species.

The era of Hellén culminated in a revised list of Finnish Diptera by Walter Hackman (1980a, 1980b, 1980c) in cooperation with Bernhard Lindeberg and Rauno Väisänen. The number of species had increased to 4852. Hans Silfverberg succeeded Hellén as the author of regular updates on additions and deletions to the Finnish insect fauna (Silfverberg 1981, 1986, 1991, 1996, 2007, 2012).

Nearly thirty-five years have passed since Hackman's checklist. The number of Diptera species known from Finland has increased by more than two thousand species since 1980 (an increase of more than 40%). Several hundred erroneous records have been recognized during the same period. Many new names have been introduced and others found invalid, incorrectly used, or synonymized. The Diptera fauna of the whole Palaearctic Region has been catalogued (Soós and Papp 1984–1993) and many new local, regional, or global checklists have been published.

At this point, an updated checklist is urgently needed to provide a current reference to the Diptera fauna of Finland as a fresh starting point for further studies into the taxonomy, ecology, and other aspects of flies in Northern Europe.

Methods and format

Definition of a checklist

There is no universally accepted definition for an entomological checklist. The word is often used for lists of species with more information than merely valid names, but without comprehensive details on nomenclature or distribution and incomplete literature references. This new checklist of Finnish Diptera falls into category 5 on the comprehensiveness scale of Thompson and Knutson (1987). It does include full names with authorships and some but not all synonyms. Some literature references are provided in an Suppl. material 2.

National insect checklists have traditionally included the species recorded at least once from the country. Exotic imports without locally reproducing populations are usually excluded, but vagrants are included. This is by no means the only possible approach: the latest Danish list (Petersen and Meier 2001) use a predictive approach: it lists not only the species actually recorded from the country, but also those that are likely to be present based on the fauna of neighboring countries. The latter method works best when the fauna of the surrounding areas is at least as well known as the study area.

Taxonomic, geographical, and temporal limits

This checklist covers the Diptera fauna of the Republic of Finland. Only species recorded at least once within the current (*i.e.* post-1944) borders are included.

Many species were originally reported from Finland on the basis of specimens collected from areas ceded to Russia in 1944. If no reliable records (preferably voucher specimens) from within the current borders of the country exist, species were excluded from the checklist. In some cases – *e.g.* the muscid *Coenosia comita* (Huckett, 1936) – it has been impossible to determine whether the purported Finnish collecting localities fall within the current borders of the country. These species are indicated with a question mark on the checklist and are usually accompanied by a comment in the Notes section of the relevant paper.

No fossil or subfossil records were considered during the preparation of the checklist. Nationally extinct species are included. In practice, the oldest collected Diptera specimens from Finland are from the early 19th century, so all of the species in this checklist have been found in the country at least once during the last two hundred years.

Data sources and validation

Draft checklists for each family were created in the latter part of 2012 by combining data from the most recent checklist of the Finnish fauna of the family in question, the Palaearctic Catalog (Soós and Papp 1984–1993), Fauna Europaea (Beuk and Pape

2012), Silfverberg's updates to Hackman's checklist and references therein, other relevant scientific literature, and the Finnish Insect Record Database (Finnish Museum of Natural History 2013). From here onwards, the individual authors of each checklist paper were responsible for data validation.

For a great majority of families, the next step was examining the major Diptera collections in Finland (see the Acknowledgments). Fortunately, these collections have voucher specimens for most Diptera species reported from the country. If no recently identified specimens from the country could be found, the reliability of the record was judged by section authors based on details provided in the literature. For example, the record of *Alliopsis longiceps* (Ringdahl, 1935) from Finland was rejected. While Ringdahl correctly recorded this species from Finland in 1935, the type location ("Kuusamo bei Paanajärvi") is now Russian territory, and no later observations have been published.

Exceptions to the procedure include Trichoceridae, Ceratopogonidae, Cecidomyiidae (subfamily Cecidomyiinae), and Phoridae (genus *Megaselia* Rondani, 1856), for which the checklists are largely based on a critical literature review. For more details on sources and validation, see the introductions and notes of individual checklist papers.

Checklist structure and presentation

The new checklist of the Diptera of Finland is presented in three formats: a series of papers each covering one or more families, a comma separated values (CSV) file with the full taxon list, and a PDF (portable document format) file with literature references for species records. The latter two are included as electronic appendices to this paper.

All checklist papers follow the same general format. An introduction to the families covered is followed by a table or list of number of species recorded from the world, Europe, and Finland. An estimate of the faunistic level of knowledge is also given on a simple three-step scale (poor–average–good). This estimate is admittedly very subjective, being based on individual authors' judgment. The following factors were considered: the number of species known from Finland in comparison with neighboring countries, taking into account known habitat preferences, etc., of absent species; the number of specialists who have worked with Finnish fauna; the number of publications on the Finnish fauna; and the quantity and quality of identified material collected from Finland.

The Checklist section of each paper starts with the systematic position of the family or families treated. As an example, the checklist of lauxanoid flies starts with:

suborder Brachycera Macquart, 1834
clade Eremoneura Lameere, 1906
clade Cyclorrhapha Brauer, 1863
infraorder Schizophora Becher, 1882
clade Muscaria Enderlein, 1936
parvorder Acalyptratae Macquart, 1835
superfamily Lauxanoidea Macquart, 1835

The family-level classification used follows mostly Marshall (2012), with exceptions noted in the Introductions of individual papers. The presentation order of subfamilies, tribes, genera, and subgenera can be either alphabetical or systematic depending on the author's preference. Species are always listed alphabetically within a genus or subgenus.

Each species record starts with the name of the taxon, the author's name, and the year of description. Doubtful records are indicated with a question mark (?) before the species name. The valid name may be followed by one or more additional names used for the same taxon. These names can be younger synonyms, preoccupied names, misidentifications, or common misuses in Finnish or international literature. As an example, the following entry lists three additional names used for *Rhamphomyia trilineata*.

Rhamphomyia trilineata Zetterstedt, 1859

- = *sulcatina* Collin, 1926
- = *tibialis* auct. nec Meigen, 1822
- = *propinqua* misid.

R. sulcatina Collin is a younger synonym of *R. trilineata*. The name *R. tibialis* Meigen was erroneously used for this species by Frey (1956) and others; the genuine *R. tibialis* of Meigen has not been found in the Nordic countries. Frey et al. (1941) misidentified this species as *R. propinqua* de Meijere (in reality a junior synonym name for *R. sulcata* Meigen).

Table 1 lists abbreviations used in the checklist papers.

The checklist section is followed by a list of species not included on the checklist for various reasons. Excluded species comprise species recorded only from areas ceded to Russia before 1945, exotic species occasionally imported to Finland by man without locally reproducing populations, records based on misidentifications, etc. The Notes section presents authors' comments on individual taxa.

Table 1. Common abbreviations used in the checklist papers.

Abbreviation	Word or term	Interpretation
aff.	<i>affinis</i>	affined to, near
auct. nec	<i>auctorum, nec</i>	wrong interpretation, literally 'of authors, not'
cf.	<i>confer</i>	compare with (may be identical with)
coll.	collective	collective name for sister species not easily separable by morphology
emend.	emendation	an intentional alternative spelling
misid.	misidentified	
nom. dubium	<i>nomen dubium</i>	a name with uncertain meaning
nom. nudum	<i>nomen nudum</i>	a name without a proper scientific definition
pr.	<i>prope</i>	near
preocc.	preoccupied	preoccupied by an older homonymous name
sg.	subgenus	
sp.	species	
suppr.	suppressed	a name made unavailable by an ICZN decision
var.	variety	a described variety

Discussion

Table 2 presents a summary of the results for each family of Diptera recorded from Finland, which includes the number of species known from the country now; in the previous checklist (Hackman 1980a, 1980b, 1980c); and the difference between the two checklists in species counts and as a fraction of the fauna known in 1980.

The Diptera has traditionally been split into two suborders, Nematocera and Brachycera. It is now generally agreed that while Brachycera is a monophyletic lineage, Nematocera is not (see Yeates et al. 2007 and references therein). The Brachycera may have evolved from a bibionomorphan ancestor, but this has so far proved difficult to confirm (Lambkin et al. 2013). The systematic order of Table 2 follows Marshall (2012), with one exception: Conopoidea is given superfamily status. Families are listed alphabetically within each superfamily.

Two nematocerous families dominate by absolute numbers of species: the non-biting midges (Chironomidae) with 780 species, and the true fungus gnats (Mycetophilidae, 691 spp.). These two families also show the largest number of new species reported since 1980 (369 and 260 species respectively). Hoverflies (Syrphidae, 362 spp.) is the largest brachyceran family, followed closely by tachinid parasitic flies (Tachinidae, 319 spp.). The largest absolute increases are seen in Tachinidae (118 spp.) and Anthomyiidae (112 spp.). The relative number of moth fly (Psychodidae) species has more than tripled since Hackman's checklist, mostly due to the work of Jukka Salmela. Among the larger families, major increases are also seen in the Pipunculidae (98% increase), Cecidomyiidae (161%), and Chironomidae (90%).

Most Diptera families show a decreasing trend in the number of species with latitude in Europe, but some are genuinely more diverse in the boreal zone (see Kjærandsen et al. 2007). The number of species known from Finland compares favorably with the results from neighboring countries (see Table 3). With 6920 species, Finland has the highest reported Diptera diversity among the Nordic countries. Only Germany (9544 species, Schumann 2009) and the Czech Republic (7917 spp., Jedlička et al. 2009) of all the North and Central European countries report significantly higher national Diptera faunas. This must, however, be at least partially attributed to differences between surveying intensity and the history of various countries. Most countries have only a few (if any) active dipterologists. Up until the last decade, access to the taxonomic literature required for Diptera identification was restricted to those working in close cooperation with major taxonomic institutes.

The number of species present in an area does usually increase with the size of the area (see Ulrich and Buszko 2003 for an example involving European insects). Peterson and Meier (2001) presented a species-area curve (of type IV, see Scheiner 2003) for Diptera species of European countries. Figure 1, based on Table 3, is an updated version of their figure. Two simple models (linear and logarithmic) were fitted to the data using least squares fits. One should, however, not draw too many conclusions from these models: the true number of Diptera species present in each country is likely to be significantly larger than the known number of species. Furthermore, large – or at

Table 2. Number of species recorded from Finland for each Diptera family. Systematic order follows Marshall (2012).

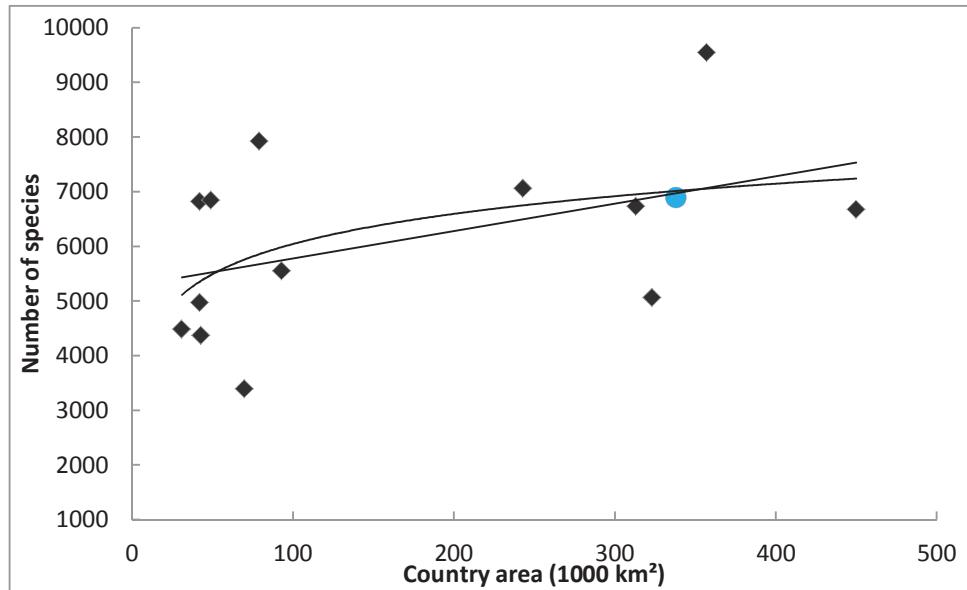

Figure 1. The species-area curve for some Northern, Western and Central European countries based on Table 3, excluding the Baltic states (see also Fig. 1 in Petersen and Meier 2001). Data for Finland is marked by a circle, other countries by rectangles. The two lines show linear and logarithmic least-squares fit models for the data.

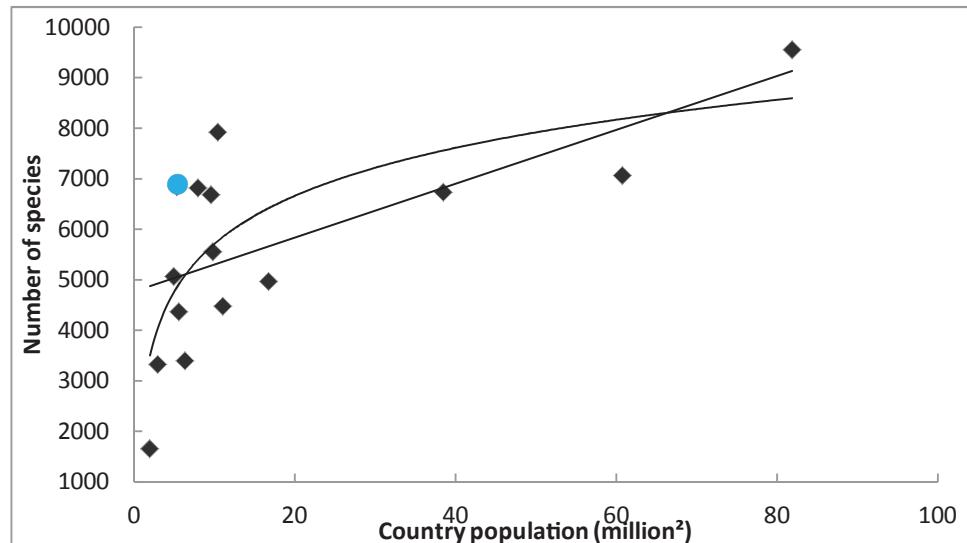

Figure 2. The species-population curve for some Northern, Western and Central European countries based on Table 3. Data for Finland is marked by a circle, other countries by rectangles. The two lines show linear and logarithmic least-squares fit models for the data.

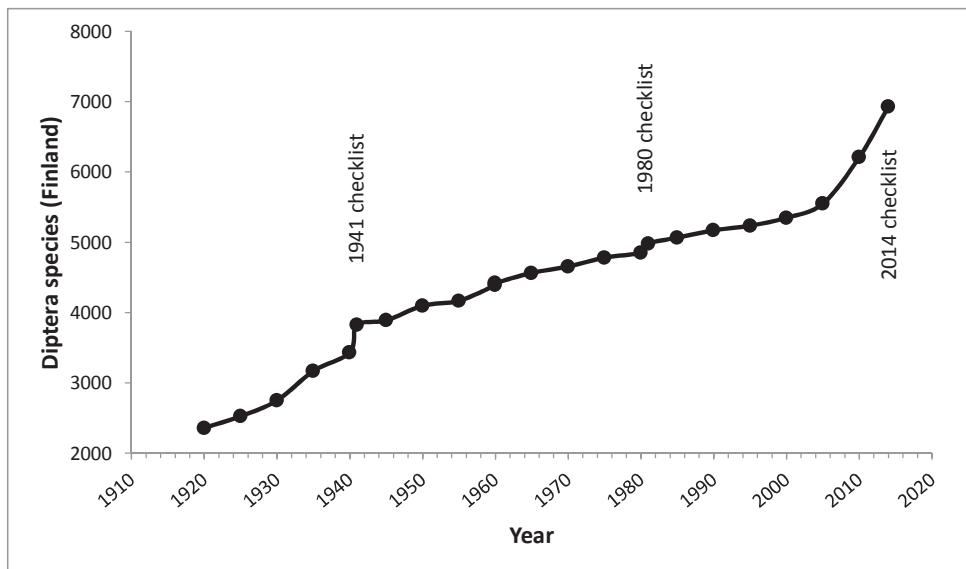

Figure 3. Total number of Diptera species known from Finland over time based on the 5-year summaries by Hellén and Silfverberg and the three checklists of Finnish Diptera. The publishing years of the three checklists are noted.

Table 3. Recent Diptera checklists from north and central European countries. The species numbers of nematoceran, brachyceran, and all Diptera are listed for each country. Species of doubtful occurrence are not included in the counts.

Country	Reference	# of species recorded		
		nematoceran	brachyceran	all Diptera
<i>Nordic countries</i>				
Finland		2932	3989	6920
Sweden	Cederberg et al. (2010)	2260	4410	6670
Norway	Gammelmo et al. (2010)	1936	3116	5052

least populous countries—countries are more likely to harbor dipterists, who contribute faunistic records (see Figure 2).

From an accumulation curve of new records over the last century (Figure 3), one can immediately see that the Finnish fauna is far from completely known. If almost all species present in the country had already been found, one would expect the rate of new records to diminish (but not fall to zero as genuine expansive species would still occasionally arrive). What has actually happened is the opposite; the rate of new discoveries has increased in the last decade. The number of species found as new to Finland during each five-year period seems to reflect the number of active dipterologists in the country. To a degree, this may represent a backlog from the 1980s and 1990s, when the number of dipterists collecting in Finland and publishing new faunistic records was smaller than during the previous 70 years, or in the 21st century. Still, one could predict that the true number of Diptera species present in Finland may be well over eight thousand species, including hundreds of still unknown and undescribed species (Fontaine et al. 2012).

Acknowledgments

Where to begin? Creating this checklist has very much been a collaborative effort, with many amateur and professional dipterists providing insightful commentary and snippets of data since this project began in the year 2002.

First and foremost, I want to thank all authors of the papers in this issue of *ZooKeys*, and Jukka Salmela, the coeditor of this checklist, for taking responsibility for the papers dealing with the lower flies. This project would not have been possible without the existence of Finnish entomological museums and their sympathetic staff: the Finnish Museum of Natural History (MZH), the Zoological Museums of the University of Turku, University of Oulu, and University of East Finland, the Kuopio Natural History Museum, the Forssa Nature Museum, and the Tampere Museum of Natural History (Vapriikki). Equally critical was the support of Finnish amateur entomologists with significant private Diptera collection, including Jari Flinck (Helsinki), Antti Haarto (Turku), Jari Ilmonen (Karkkila), Jevgeni Jakovlev (Helsinki), Jere Kahanpää (Helsinki), Iiro Kakko (Hämeenlinna), Sakari Kerppola (Helsinki), Lauri Paasivirta (Salo), Jouni Penttinen (Jyväskylä), Jukka Salmela (Rovaniemi), and Kaj Winqvist (Turku). In addition, Miroslav Barták, Hans Bartsch, Christer Bergström, Peter Chandler, Milan Chvála, Henry Disney, Neal Evenhuis, Steve Gaimari, Jean-Paul Haenni, Christian Kehlmaier, Valery Korneyev, Iain McGowan, Bernhard Merz, Verner Michelsen, Lorenzo Munari, Alexei Polevoi, Marc Pollet, Adrian Pont, Jindřich Roháček, Michael von Tschirnhaus, Andrzej Woźnica, and Theo Zeegers, among others, contributed by examining collection specimens, providing literature, commenting on preliminary lists or species, and being supportive and friendly when pestered for answers.

The Finnish Expert Group for Diptera (<http://dipteratyoryhma.myspecies.info/>) provided funds and other support, allowing the author and Kaj Winqvist to spend a

few months examining Finnish Diptera fulltime in 2003–2007. Finally, I would personally like to thank my friends K. Winqvist and A. Haarto for introducing me to the fascinating and curious world of flies.

Supplementary material 1

Electronic appendix 1: CVS taxon file

Authors: Jere Kahanpää

Data type: (measurement/occurrence/multimedia/etc.)

Explanation note: This file is encoded as UTF-8 text with a semicolon as the field separator. In Excel, the CSV file is best opened using the Data/From Text functionality.

The data is formatted as Darwin Core (Darwin Core Task Group 2009) compliant.

The following fields are provided: taxonID [Fauna Europaea URN if available], scientificName, taxonRank, higherClassification, order, family, genus, subgenus, specificEpithet, scientificNameAuthorship, identificationQualifier, identificationRemarks, bibliographicCitation, taxonConceptID.

Copyright notice: This dataset is made available under the Open Database License (<http://opendatacommons.org/licenses/odbl/1.0/>). The Open Database License (ODbL) is a license agreement intended to allow users to freely share, modify, and use this Dataset while maintaining this same freedom for others, provided that the original source and author(s) are credited.

Supplementary material 2

Electronic appendix 2: PDF literature references file

Authors: Jere Kahanpää

Data type: References list.

Explanation note: A PDF file with additional references to first published records is also provided. Cross-references to Hackman's 1980 checklist are included. This file includes an index to genus- and species-level names.

Copyright notice: This dataset is made available under the Open Database License (<http://opendatacommons.org/licenses/odbl/1.0/>). The Open Database License (ODbL) is a license agreement intended to allow users to freely share, modify, and use this Dataset while maintaining this same freedom for others, provided that the original source and author(s) are credited.

Checklist of the infraorder Tipulomorpha (Trichoceridae, Tipuloidea) (Diptera) of Finland

Abstract

A checklist of the infraorder Tipulomorpha: families Trichoceridae, Pediciidae, Limoniidae, Cylindrotomidae and Tipulidae (Diptera) recorded from Finland.

Keywords

Checklist, Finland, Diptera, Trichoceridae, Pediciidae, Limoniidae, Cylindrotomidae, Tipulidae

Introduction

Trichoceridae is a small family of medium sized gnats, mostly of Holarctic distribution. Larvae live in different decaying matter like leaves, wood, fungi or dead mammals. Adults form numerous swarms that are encountered during colder fall and spring months or warmer winter days in warmer climates or during the short summer months in northern latitudes.

No comprehensive and up to date key exists for north European adults or larvae, but a combination of Shtackelberg (1988), Starý (1999) and Petrašiūnas (2009) could be used. However, Shtackelberg (1988) must be used with caution because several species have since been published. List of trichocerids presented here is based on literature review (see Dahl 1968, Dahl and Alexander 1976), no new material has been studied.

Table 1. Number of species by family.

Family	Number of species in			Level of knowledge
	World (Oosterbroek 2014)	Europe (Pape et al. 2011)	Finland	
Tipulomorpha:				
Trichoceridae	183	50	15–17	poor-average
Pediciidae	490	63	19	good
Limoniidae	10528	545	196	good
Cylindrotomidae	71	7	7	good
Tipulidae	4280	456	114–115	good

Tipuloidea crane flies (Pediciidae, Limoniidae, Cylindrotomidae and Tipulidae) belong to the infraorder Tipulomorpha together with trichocerids (Wiegmann et al. 2011). Following Starý (1992), most European authors distinguish four families: Limoniidae, Tipulidae, Pediciidae and Cylindrotomidae. North American authors, strongly influenced by C.P. Alexander, usually prefer a single family, Tipulidae; other families, *sensu* Starý, are there subfamilies or tribes (Byers 1992, Petersen et al. 2010). According to a recent phylogenetic analysis (Petersen et al. 2010), two families are recognized, Tipulidae and Pediciidae, but the consensus tree of that analysis had many unresolved polytomies. Crane fly larvae occur usually in moist or (semi)aquatic habitats, but larvae may also be found on mosses, in dry soil, fungal fruiting bodies and dead wood. Cylindrotomids are herbivorous, feeding on vascular plants or mosses. Most larvae of (semi)aquatic species have open spiracles and are dependent on aerial oxygen supply, but truly aquatic species are able to withdraw dissolved oxygen through the cuticle of tracheal gills.

An annotated list of Finnish crane flies was provided by Salmela (2012a) and a few species were later added in subsequent papers (Salmela 2012b, 2013). Species richness of Finnish crane flies is negatively correlated with latitude but mire-dwelling crane flies have anomalous species richness gradient (Salmela 2012). Finnish crane flies are rather well known, but perhaps up to 20 more species could be found from Finland (Salmela 2013).

Abstract

A checklist of the families Chaoboridae, Dixidae, Thaumaleidae, Psychodidae and Ptychopteridae (Diptera) recorded from Finland is given. Four species, *Dixella dyari* Garret, 1924 (Dixidae), *Threticus tridactilis* (Kincaid, 1899), *Panimerus albifacies* (Tonnoir, 1919) and *P. przhiboroi* Wagner, 2005 (Psychodidae) are reported for the first time from Finland.

Keywords

Finland, Diptera, species list, biodiversity, faunistics

Introduction

Psychodidae or moth flies are an intermediately diverse family of nematocerous flies, comprising over 3000 species world-wide (Pape et al. 2011). Its taxonomy is still very unstable, and multiple conflicting classifications exist (Duckhouse 1987, Vaillant 1990, Ježek and van Harten 2005). The nomenclature used in the Finnish check-list follows the

Norwegian one (Kvifte et al. 2011). For differences between the taxonomy used herein and that used in previous works on Finnish Psychodidae (e.g. Hackman 1980, Salmela 2003, 2005, Salmela et al. 2007, Autio and Salmela 2010) see Kvifte et al. (2011). Two species, *Pneumia nubila* and *Pneumia palustris*, listed in the previous check-lists by Hackman (1980) and Wagner (2013) have not been confirmed through study of material. Of these, *P. palustris* have been suggested to be synonymous with *Pneumia gracilis* (Eaton, 1893) (Withers 1989). Both these species have been linked to some taxonomic confusion in the past, and thus the record of *P. nubila* may represent *Pneumia trivialis*. The present check-list contains the first Finnish records of the species *Threticus tridactilis* (Kincaid, 1899), *Panimerus albifacies* (Tonnoir, 1919) and *P. przhiboroi* Wagner, 2005 (see Notes).

Finnish Psychodidae are very well studied compared to other Nordic countries, however new species are still being discovered at a regular rate. Most of these are new country records, but in recent years the fauna has also yielded some species new to science (Salmela et al. 2012, Kvifte unpubl.). This trend is likely to continue. Probably between twelve and thirty further species can be expected to be found in the Finnish fauna. There are no good identification sources available for Psychodids, as all works suffer from taxonomic or nomenclatural errors and/or insufficient descriptions. The best works relevant to the Finnish fauna are Vaillant (1971–1983), Withers (1989) and Wagner (1997c, genera only).

Phantom midges (Chaoboridae) are close relatives to mosquitoes (Culicidae) and meniscus midges (Dixidae) (Saether 1970, 1997). There are around 50 known species of phantom midges in the world and 15 in the palearctic region, of which five are holarctic species. In Finland, there are eight species in three genera (Hirvenoja 1960, Hackman 1980, in which the species in the genus *Mochlonyx* were still doubtful).

The only strictly lacustrine species in Finland is *Chaoborus flavicans*. The other species live in small fishless lakes, ponds and springs where their predators are mainly dragon flies, dytiscid beetles and frogs. *Chaoborus nyblaei* and *Cryphila lapponica* are found from small fishless ponds on fells and ponds created by melting water. However, in 2013 larvae of *C. nyblaei* were found from the boreal zone, NE Lapland (Savukoski) from a small but permanent pond. *Chaoborus pallidus* lives in eutrophic lakes and small lakes in southern and central Finland (Hirvenoja 1960, 1963, Paasivirta 2002). However, there have not been any systematic surveys of the fauna across the biogeographic provinces and the conservation statuses of the species have not been evaluated. Finnish species can be identified by using Saether (1997, 2002).

Meniscus midges (Dixidae) belong to infraorder Culicomorpha. There are nearly 200 known species of which 53 occur in the Palaearctic region. In Finland two genera and 16 species are present (Hackman 1980, Salmela 2003, Salmela et al. 2007). One species (*Dixella dyari* Garret, 1924) is reported here for the first time from Finland (see Notes). Larvae of meniscus midges dwell in or slightly above water meniscus, having a characteristic U-shaped position (Wagner 1997a). Members of the genus *Dixella* are associated with lentic or slow flowing waters, such as ponds, lake shores and bog pools. Species of the genus *Dixa* are lotic, dwelling in running waters of varying size. Two Finnish species, *Dixa dilatata* and *D. submaculata* prefer springs and spring brooks. The Finnish fauna is generally rather well known, although three species have hitherto

Table 1. Number of species by family.

Family	Number of species in			Level of knowledge
	World (Pape et al. 2011)	Europe	Finland	
Psychodomorpha:				
Psychodidae	2958	493	61–63	average
Culicomorpha:				
Chaoboridae	54	9	8	good
Dixidae	186	32	16	average
Thaumaleidae	182	76	1	good
Ptychopteromorpha:				
Ptychopteridae	69 (Wagner et al. 2008)	14	7	good

been collected from single localities. One northern *Dixa* species close to *D. dilatata* is still undescribed. A majority of the species can be identified by using Martini (1928), Peus (1934, 1936), Vaillant (1967) and Disney (1999).

Trickle midges (Thaumaleidae) is a small family belonging to infraorder Culicomorpha. Globally, nearly 200 species are known of which 76 are European. Central European mountains harbor a rich assemblage of trickle midges (Wagner 2002), at least if compared to the poor diversity (5 spp.) in Fennoscandian area (Wagner 1997b, Andersen et al. 2013). Only one species, *Thaumalea truncata*, has been hitherto recorded from Finland (see the discussion in Andersen et al. 2013). Larvae of trickle midges dwell on hygropetric substrates or splash zones of running waters (Wagner 1997b). *Thaumalea truncata* occurs mainly in northern Finland, both boreal and subarctic ecoregions, and adult specimens have been caught around springs and headwater streams (Salmela 2003, Salmela 2008).

Phantom crane flies (Ptychopteridae) belong to infraorder Ptychopteromorpha, being a sister group of Psychodomorpha and Culicomorpha (Wiegmann et al. 2011). Ptychopteridae is a small family with over 69 species in the world and 14 in Europe. Seven species are known from Finland, all belonging to the genus *Ptychoptera*. Only one Finnish species, *Ptychoptera minuta*, is widespread, locally abundant and almost ubiquitous. Other species are much less frequent, occurring in peatlands, headwater streams, springs and swamps. Adult *Ptychoptera* superficially resemble Tipuloidea crane flies, being slender and having long legs. Larvae of *Ptychoptera* live in shallow aquatic habitats, usually in soft substrates (Andersson 1997). Finnish species can be identified by using Andersson (1997) and Krzeminski (1986).

Abstract

A checklist of the Culicidae (Diptera) recorded from Finland is provided.

Keywords

Checklist, Finland, Diptera, Culicidae, mosquitoes

Introduction

The family Culicidae comprises 3539 extant species world-wide. The Finnish fauna is relatively small in relation to world fauna. Because of medical importance this family has been extensively taxonomically studied but still new species are discovered. The generic and subgeneric classifications of Culicidae follow Reinert et al. 2009. Because of some confusing use of names in the first half of the twentieth century in the Finnish literature, all available names are included in the list for clarity. The most important work on the Finnish mosquitoes was done by Pirkka Utrio (1975, 1976, 1977, 1978, 1979).

Number of species:

World: 3539 extant species + 25 fossil species (Harbach 2014)

Europe: 104 species (Snow and Ramsdale 2004)

Finland: 38 species

Checklist

suborder Nematocera Dumeril, 1805
infraorder Culicomorpha Hennig, 1948
superfamily Culicoidea Meigen, 1818

CULICIDAE Meigen, 1818

ANOPHELINAE Grassi, 1900

Anopheles Meigen, 1818

sg. *Anopheles* Meigen, 1818

Anopheles beklemishevi Stegny & Kabanova, 1976

= *maculipennis* auct. in part

Anopheles claviger (Meigen, 1804)

Anopheles messeae Falleroni, 1926

= *claviger* (of Fabricius, 1805) auct. nec Meigen, 1804

= *maculipennis* auct. in part

CULICINAE Meigen, 1818

Aedes Meigen, 1818

Aedes cinereus Meigen, 1818

Aedimorphus Theobald, 1903

Aedes vexans (Meigen, 1830)

Coquillettidia Dyar, 1905

Coquillettidia richiardii (Ficalbi, 1889)

Culex Linnaeus, 1758

sg. *Culex* Linnaeus, 1758

Culex pipiens Linnaeus, 1758

Culex torrentium Martini, 1925

sg. *Neoculex* Dyar, 1905

Culex territans Walker, 1856

= *apicalis* auct. nec Adams, 1903

Culiseta Felt 1904

= *Theobaldia* Neveu-Lemaire, 1902 preocc.

sg. *Culicella* Felt, 1904

Culiseta morsitans (Theobald, 1901)

Culiseta ochroptera Peus, 1935

sg. *Culiseta* Felt, 1904

Culiseta alaskaensis (Ludlow, 1906)

Culiseta annulata (Schrank, 1776)

Culiseta bergrothi (Edwards, 1921)

= *glaphyoptera* auct. nec (Shiner, 1864)

Culiseta subochrea (Edwards, 1921)

Dabliana Reinert, Harbach & Kitching, 2006

Dahliana geniculata (Olivier, 1791)

Ochlerotatus Lynch Arribalzaga, 1881

sg. *Ochlerotatus* Lynch Arribalzaga, 1881

Ochlerotatus annulipes (Meigen, 1830)

Ochlerotatus euedes (Howard, Dyar & Knab, 1913)

= *beklemishevi* Denisova, 1955

Ochlerotatus cantans (Meigen, 1818)

= *waterhousei* (Theobald in Waterhouse, 1905)

= *maculatus* auct. nec (Meigen, 1804)

= *rusticus* auct. nec (Rossi, 1790)

Ochlerotatus caspius (Pallas, 1771)

Ochlerotatus cataphylla Dyar, 1916

Ochlerotatus communis (De Geer, 1776)

= *nemorosus* (Meigen, 1818)

Ochlerotatus cyprius Ludlow, 1920

= *freyi* Edwards, 1921

Ochlerotatus diantaeus Howard, Dyar & Knab, 1912

Ochlerotatus dorsalis (Meigen, 1830)

Ochlerotatus excrucians (Walker, 1848)

Ochlerotatus flavesiensis (Müller, 1776)

= *lutescens* (Fabricius, 1775)

= *variegatus* (Schrank, 1781)

Ochlerotatus hexodontus Dyar, 1919

Ochlerotatus impiger (Walker, 1848)

= *parvulus* (Edwards 1921)

= *nearcticus* auct. nec (Dyar, 1922)

Ochlerotatus intrudens Dyar, 1919

Ochlerotatus leucomelas (Meigen, 1804)

Ochlerotatus nigrinus (Eckstein, 1918)

= *sticticus* auct. nec Meigen 1828

Ochlerotatus nigripes (Zetterstedt, 1838)

= *alpinus* auct. nec (Linnaeus) nomen dubium

Ochlerotatus pionips Dyar, 1919

Ochlerotatus pullatus (Coquillett, 1904)

Ochlerotatus punctodes Dyar, 1922

Ochlerotatus punctor (Kirby, 1837)

Ochlerotatus riparius Dyar & Knab, 1907

Notes

Anopheles maculipennis Meigen, 1818. Not recorded in Finland. All previous reports refer to *An. messeae* or *An. beklemishevi*.

Anopheles claviger (of Fabricius, 1805). Mistaken name usage for *Anopheles maculipennis* s. lat. in the early 20th century Finnish literature which then followed the Italian tradition.

***Culex pipiens* f. *molestus* Forskåhl, 1775.** This is not a valid species level taxon. It is a man biting form of the mainly bird biting *Culex pipiens*. Both have been reported from Finland.

***Dabliana geniculata* (Oliver, 1791).** A possibly occasional specimen of this species was collected in Western Finland, verified by Christine Dahl (Itämies 1981).

***Ochlerotatus alpinus* L. Frey (1921)** included this invalid species name (see Harbach 2014) in the Finnish list with a question mark. Hellén (1931) withdrew it from the Finnish list. According to Utro (1977), Frey refers to *nigripes* (Zetterstedt, 1838).

***Ochlerotatus behningi* Martini, 1926.** The species is listed for both Finland and Sweden in Dahl (1997). Lundström et al. (2013) do not accept the report for Sweden because of absence of documented locality. Based on the same argument, we do not include this species in the Finnish list.

***Ochlerotatus (Rusticoidus) rusticus* (Rossi, 1790).** Dahl (1997) listed this species for Finland. There are, however, no confirmed collections of the species in Finland. Frey (1921) listed *Aedes maculatus* Meigen (with *A. waterhousei* Theobald as a presumed synonym) from Finland. According to Natvig (1948), Meigen made a mistake in 1830 when he stated that “*maculatus* is the male of *cantans*” instead of “*reptans* is the male of *cantans*”, leading to a switch in synonyms. According to Minar (1990) the correct combinations should be as follows: *maculatus* Meigen is a synonym of *rusticus* (Rossi) and both *reptans* (Meigen) and *waterhousei* (Theobald) are synonyms of *cantans* (Meigen). From this context, it is obvious that Frey refers to the common species *cantans* and not to the southern species *rusticus*.

***Ochlerotatus sticticus* (Meigen, 1838).** The species was reported from Finland (Kilpisjärvi) by Frey (1932) and listed for Finland in Frey and Storå (1941). According to Natvig (1948) and Utro (1979) this record refers to *Aedes nigrinus* (Eckstein). In addition, it was reported by Syrjämäki (1960) in Finland (Hanko: Tvrärminne) but later withdrawn by the author according to Utro (1979, personal communication). It was also included for Finland in Dahl (1997), probably based on the former reports. According to Gutsevich et al. (1970) this species occurs in Russian Karelia. Thus, *A. sticticus* is not included in the Finnish list.

***Culex apicalis* Adams, 1903.** Originally reported by Martini (1928) from Finland. All European reports of this Nearctic species before 1950 represent the closely related Holarctic species *Culex territans* (Becker et al. 2003).

Abstract

A checklist of the family Ceratopogonidae (Diptera) recorded from Finland is provided.

Keywords

Checklist, Finland, Diptera, Ceratopogonidae

Introduction

The biting midges (Ceratopogonidae) have only occasionally been studied by Finnish entomologists. Most notable are the studies by Lundström (1910, 1916), Munsterhjelm (1920), Storå (1939) and Hämäläinen (1988). The last mentioned reference is not published in print but included because the determinations have been checked by Peter Havelka. Other species reports were given by Frey (1918), Forsius (1924), Krogerus (1960), Meinander (1977) and Hildén et al. (2010). A considerable part of the species information has been contributed by foreign specialists, Edwards (1924), Clastrier (1961, 1991), Delecolle et al. (1983), Borkent and Bissett (1990), Szadziewski (2001), Ashe et al. (2007), Dominiak et al. (2007), Dominiak and Szadziewski (2010) and Dominiak (2012).

A World Catalogue of Ceratopogonidae is maintained by Art Borkent (2014), updated Jan. 20, 2014.

Number of species:

World: 6180 extant species + 274 fossil species (Borkent 2014)

Europe: 567 species (Fauna Europaea, Szadzievski, Borkent and Dominiak 2014)

Finland: 97 species

Faunistic knowledge level in Finland: medium

 = *bispinosa* Lundström, 1916, preocc.
- Palpomyia serripes* (Meigen, 1818)
 = *transfuga* (Staeger, 1839)
- Palpomyia tibialis* (Meigen, 1818)

Notes

***Atrichopogon meloesugans* Kieffer, 1922.** This species was restored from synonymy with *A. winnertzi* Goetghebuer, 1922 by Szadziewski et al. (2007).

***Dasyhelea modesta* (Winnertz, 1852).** Old records reported before 1988 of this species (as *D. aestiva* (Winnertz, 1852) or *D. longipalpis* (Winnertz, 1852)) are questionable according to Dominiak and Szadziewski (2010). Records by Hämäläinen (1988) are valid.

***Ceratopogon neglectus* Winnertz, 1852.** Reported by Lundström (1910) as *Culicoides neglectus* from Finland. Szadziewski (1984) transferred it to *Dasyhelea*. Remm (1988) considered it a doubtful Ceratopogonidae. Because the type specimen is lost and the original description is insufficient it is considered nomen dubium by Dominiak and Szadziewski (2010). The species is removed from the Finnish list.

***Culicoides vexans* (Staeger, 1839).** Reported from Finland by Lundström (1910) who listed *Culicoides albicans* as a probable synonym. *C. vexans* was omitted in Frey and Storå (1941) and Havelka (1978) but included in Hackman (1980) and Szadziewski et al. (1997) (citing Hackman). According to Delecolle et al. (1983) Lundström's *C. vexans* represents *C. albicans*. *C. albicans* is included in the Finnish list and *C. vexans* is removed from the Finnish fauna.

***Culicoides reconditus* (Campbell & Pelham-Clinton, 1960) and *C. riouxi* Callot & Kremer, 1961.** *C. riouxi* was treated as a synonym of *C. reconditus* in Borkent

and Wirth (1997) but restored from synonymy in Borkent (2012). Delecolle et al. (1983) reported *C. riouxi* as a valid species from Finland (N: Tvärminne). The record of *C. reconditus* by Hämäläinen (1988) from Finland (Ta: Riihimäki) was checked by Havelka but because he considered *C. riouxi* and *C. reconditus* synonyms the identity of Hämäläinen's record remains unclear (see Havelka and Aquilar 1999 and Huldén et al. 2008 in accordance with Borkent and Wirth 1997). As a consequence *C. reconditus* is not included in the Finnish list.

***Culicoides salinarius* Kieffer, 1914.** According to Delecolle et al. (1983) this species is indistinguishable from *C. manchuriensis* Tokunaga, 1941 which is reported from Russian Karelia by Glukhova (1957).

***Probezzia concinna* (Meigen, 1818).** The record listed by Krogerus (1960) from Kuusamo district (by mistake as 'coracina') is tentatively interpreted to be in the same locality in Finland as *Probezzia seminigra*, Kuusamo: Isosuo (Storå 1937). *P. concinna* was listed as a variety of *P. seminigra* in Frey and Storå (1941). Storå obviously identified both taxa. The species is here interpreted as a Finnish species.

***Palpomyia flavipennis* Meigen, 1804.** Misspelled species name for *P. flavipes* (Frey and Storå 1941).

***Palpomyia aterrima* Goetghebuer, 1921.** The record listed by Krogerus (1960) from Kuusamo district is from the Russian part according to locality data in Storå (1939). Not recorded in Finland.

***Palpomyia spinipes* (Meigen) in Panzer, 1806.** The record listed by Krogerus (1960) from Kuusamo district is from the Russian part according to the bog type information. Not recorded in Finland.

Abstract

A checklist of the family Chironomidae (Diptera) recorded from Finland is presented.

Keywords

Finland, Chironomidae, species list, biodiversity, faunistics

Introduction

There are supposedly at least 15 000 species of chironomid midges in the world (Armitage et al. 1995, but see Pape et al. 2011) making it the largest family among the aquatic insects. The European chironomid fauna consists of 1262 species (Sæther and Spies 2013). In Finland, 780 species can be found, of which 37 are still undescribed (Paasivirta 2012).

The species checklist written by B. Lindeberg on 23.10.1979 (Hackman 1980) included 409 chironomid species. Twenty of those species have been removed from the checklist due to various reasons. The total number of species increased in the 1980s to 570, mainly due to the identification work by me and J. Tuiskunen (Bergman and Jansson 1983, Tuiskunen and Lindeberg 1986). There has been a new rapid increase in the total number of species since 1998. I have reported 187 additional species, of which 8 have been new to science, and other researchers have reported 24 additional

species. The chironomid fauna of all biogeographical provinces has been relatively well surveyed (Paasivirta 2012, including the trapping efficiency and the collectors).

Holotypes and paratypes exist for 87 species described from Finland. 23 species have been found only in Finland, thus making them putatively endemic species. Six of these species have only been found from the original type locality. 42 species have been found only from one collecting site in Finland.

Larvae of chironomid midges are found in all types of aquatic habitats. In addition, some species (130 species, 17%) specialize in semi-aquatic environments like wet moss on wetlands and shores of lotic waters. A total of 367 species have been identified from springs and the surrounding habitats in Finland. Sixteen percent of these species are associated with or specialized in springs and 25% are semi-aquatic species (Paasivirta 2007). One hundred and seventy aquatic species have been found from marine habitats, excluding river estuaries (Paasivirta 2000 and later additions). Sixty five additional species live in the mildly brackish water in the northern part of Bothnian Bay. There are only four strictly marine species.

The conservation statuses have been estimated for 667 Finnish chironomid species. Eleven species are classified as vulnerable (VU), 21 as near threatened (NT) and 6 species as lacking sufficient information (DD) (Penttilä et al. 2010). Since the chironomid midges have not been extensively studied and no long-term studies have been performed in Finland, the only useful criteria for the assessment of the conservation statuses have been either extent of occurrence or area of occupancy.

The nomenclature of the species list is consistent with Fauna Europaea (Sæther and Spies 2013). Undescribed species are specified with appellations derived from the first collecting locality. For example *Procladius* sp. 2 “Palsa” was first found at a site called Palsa.

The list of Finnish chironomids (with bioprovincial distribution data) was last updated by Paasivirta (2012).

Number of species:

World: 7053 species (Pape et al. 2011)

Europe: 1262 species (Sæther and Spies 2013)

Finland: 780 species, incl. 37 undescribed species

Faunistic knowledge level in Finland: good

Checklist

Nematocera Dumeril, 1805

infraorder Culicomorpha Hennig, 1948

superfamily Chironomoidea Newman, 1834

CHIRONOMIDAE Newman, 1834

PODONOMINAE Thienemann & Edwards, 1937

tribe Boreochlini Brundin, 1966

BOREOCHLUS Edwards, 1938

Boreochlus thienemanni Edwards, 1938

LASIODIAMESA Kieffer, 1924

Lasiodiamesa armata Brundin, 1966

Lasiodiamesa gracilis (Kieffer, 1924)

Lasiodiamesa sphagnicola (Kieffer, 1925)

tribe Podonomini Thienemann & Edwards, 1937

PAROCHLUS Enderlein, 1912

Parochlus kiefferi (Garrett, 1925)

TRICHOTANYPUS Kieffer, 1906

Trichotanypus mariae Wirth & Sublette, 1970

Trichotanypus posticalis (Lundbeck, 1898)

TANYPODINAE Skuse, 1889

tribe Anatopyniini Fittkau, 1962

ANATOPYNIA Johannsen, 1905

Anatopynia plumipes (Fries, 1823)

tribe Coelotanypodini Coffman, 1978

= Clinotanypodini Lipina, 1928

CLINOTANYPUS Kieffer, 1913

Clinotanypus nervosus (Meigen, 1818)

tribe Macropelopiini Zavřel, 1929

APSECTROTANYPUS Fittkau, 1962

Apsectrotanypus trifascipennis (Zetterstedt, 1838)

MACROPELOPIA Thienemann, 1916

Macropelopia adaucta Kieffer, 1916

= goetghebueri (Kieffer, 1918)

Macropelopia nebulosa (Meigen, 1804)

Macropelopia notata (Meigen, 1818)

PSECTROTANYPUS Kieffer, 1909

Psectrotanypus varius (Fabricius, 1787)

tribe Natarsiini Roback & Moss, 1978

NATARSIA Fittkau, 1962

Natarsia nugax (Walker, 1856)

Natarsia punctata (Fabricius, 1805)

tribe Pentaneurini Hennig, 1950

ABLABESMYIA Johannsen, 1905

Ablabesmyia longistyla Fittkau, 1962

Ablabesmyia monilis (Linnaeus, 1758)

Ablabesmyia phatta (Egger, 1864)

ARCTOPELOPIA Fittkau, 1962

Arctopelopia barbitarsis (Zetterstedt, 1850)

Arctopelopia griseipennis (van der Wulp, 1859)

Arctopelopia melanosoma (Goetghebuer, 1933)

- CONCHAPELOPIA** Fittkau, 1957
Conchapelopia aagaardi Murray, 1987
Conchapelopia hittmairorum Michiels & Spies, 2002
Conchapelopia intermedia Fittkau, 1962
Conchapelopia melanops (Meigen, 1818)
Conchapelopia pallidula (Meigen, 1818)
GUTTIPELOPIA Fittkau, 1962
Guttipelopia guttipennis (van der Wulp, 1861)
HAYESOMYIA Murray & Fittkau, 1986
Hayesomyia tripunctata (Goetghebuer, 1922)
KRENOPELOPIA Fittkau, 1962
Krenopelopia binotata (Wiedemann, 1817)
Krenopelopia nigropunctata (Staeger, 1839)
LABRUNDINIA Fittkau, 1962
Labrundinia longipalpis (Goetghebuer, 1921)
LARSIA Fittkau, 1962
Larsia atrocincta (Goetghebuer, 1942)
MONOPELOPIA Fittkau, 1962
Monopelopia tenuicalcar (Kieffer, 1918)
NILOTANYPUS Kieffer, 1923
Nilotanypus dubius (Meigen, 1804)
PARAMERINA Fittkau, 1962
Paramerina cingulata (Walker, 1856)
Paramerina divisa (Walker, 1856)
PENTANEURELLA Fittkau & Murray, 1983
Pentaneurella katterjokki Fittkau & Murray, 1983
RHEOPELOPIA Fittkau, 1962
Rheopelopia maculipennis (Zetterstedt, 1838)
Rheopelopia ornata (Meigen, 1838)
TELMATOPELOPIA Fittkau, 1962
Telmatopelopia nemorum (Goetghebuer, 1921)

Excluded species

The numerous species that were reported by Hackman (1980), but are excluded from the current check-list, are not listed here. Reasons for deletions of those species are various, mainly due to misidentifications and nomenclatural changes.

Notes

***Chironomus pallidivittatus* Edwards, 1929.** This name is preoccupied by *C. pallidivittatus* Malloch, 1915. The European species needs a new name.

Abstract

A checklist of the family Simuliidae (Diptera) is provided for Finland and recognizes 56 species. One new record has been added (*Simulium latipes*) and one name sunken in synonymy (*Simulium carpathicum*). Furthermore, *Simulium tsheburovae* is treated as a doubtful record.

Keywords

Checklist, Finland, Diptera, Simuliidae

Introduction

Simuliidae is a relatively small family of nematoceran flies, comprised of 2,163 species (2,151 living and 12 fossil) world-wide (Adler and Crosskey 2014). Numerous taxonomical confusions and different views on nomenclature between eastern and western scientists have created confusion in blackfly studies for many decades. Some taxonomical issues concerning species occurring in North Europe have been resolved by recent synonymisations (Raastad et al. 2010, Adler and Crosskey 2014). Systematics and nomenclature of the enumeration follow that of Adler and Crosskey (2014), and only the most relevant synonyms used in previous checklists for Finland are listed.

The faunistic level of knowledge in Finland is good, only few changes were made since compilation of the previous checklist (Ilmonen and Adler 2008). Few additional species can be expected to be found, and many taxonomical issues have been resolved within the last two decades.

Number of species:

World: 2151 species (Adler and Crosskey 2014)
Europe: 230 species (Adler and Crosskey 2014)
Finland: 56 species
Faunistic knowledge level in Finland: good

= *richteri* (Enderlein, 1930)

Excluded species

Simulium fuscipes (Fries, 1824) see Notes

Simulium lineatum (Meigen, 1804) misidentified, most likely *S. equinum*

Simulium meigeni Rubzov & Carlsson, 1965 see Notes

= *pygmaeum* of some authors

Simulium tsheburovae (Rubtsov, 1956) see Notes

Notes

***Simulium fuscipes* (Fries, 1824).** Adler and Crosskey (2014) treat *fuscipes* as a valid species of *S. ruficorne* species group in the subgenus *Nevermannia*, but no known records exist from Finland.

***Simulium meigeni* Rubzov & Carlsson, 1965.** Adler and Crosskey (2014) recognize the identity of *S. meigeni* within the subgenus *Helichiella*, but there are no known records of this species in Finland. The name *pygmaeum* in Kuusela (1971) refers to the form of *pygmaeum* that is a synonym for *pusillum*, not *meigeni* (see Adler and Crosskey 2014).

***Simulium tsheburovae* (Rubtsov, 1956).** No confirmed records of this species exist from Finland (Raastad et al. 2010), and the name probably subsumes one or more of the existing species within the subgenus *Helichiella* (Adler and Crosskey 2014).

Abstract

A checklist of the families Anisopodidae, Bibionidae, Canthyloscelididae, Mycetobiidae, Pachyneuridae and Scatopsidae (Diptera) recorded from Finland. The Finnish species of these families were last listed in 1980. After that two species of Anisopodidae, four species of Bibionidae and six species of Scatopsidae have been added to the Finnish fauna and two species of Scatopsidae have been removed from the Finnish fauna.

Keywords

Checklist, Finland, Diptera, biodiversity, faunistics

Introduction

Six families (Anisopodidae, Bibionidae, Canthyloscelididae, Mycetobiidae, Pachyneuridae and Scatopsidae) are included in this paper. All six families have been rather poorly collected and studied in Finland. Lundström (1910) published a study of the family Bibionidae. During the last one hundred years, foreign specialists have con-

Table 1. Number of species by family.

Family	Number of species in			Level of knowledge
	World (Pape et al. 2011)	Europe	Finland	
Anisopodidae	77	10	7	average
Mycetobiidae	35	4	1	average
Bibionidae	760	50	17	average
Scatopsidae	390	102	30	poor
Canthyloscelididae	16	3	3	average
Pachyneuridae	5	1	1	average

tributed the majority of the new records and taxonomic treatises. Some Anisopodidae were treated by Krivosheina and Menzel (1998, 2002) and Bibionidae by Greve and Haenni (1994) and Skartveit (1999). Finnish scatopsid records were included in the synopsis of Palaearctic Scatopsidae by Cook (1969, 1972, 1974). The genera *Anapausis* Enderlein (Chandler 1999, Haenni 1984), *Colobostema* Enderlein (Haenni 2013, Krivosheina 2001) and *Aspistes* Meigen (Krivosheina 2000) have been examined in more detail. Recently Anisopodidae (Haarto 2011) and Bibionidae (Haarto 2012) have attracted some attention in the country. The only Finnish species of Pachyneuridae, *Pachyneura fasciata* Zetterstedt, 1838, was studied by Salmela and Ilmonen (2004) and removed from the Finnish Red List. The Finnish species of all six families were last listed by Hackman (1980). The Finnish faunae of anisopodids and bibionids have been recently reviewed by Haarto (2011, 2012). The nomenclature and the number of European species are presented according to the current listing of Fauna Europaea (Beuk and Pape 2013).

Abstract

A list of the 356 species of Cecidomyiidae (Diptera) recorded from Finland is presented, which comprises 6 Lestremiinae, 156 Micromyiinae, 16 Winnertziiinae, 69 Porricondylinae, and 109 Cecidomyiinae. The faunistic knowledge of Finnish Winnertziiinae, Porricondylinae and Cecidomyiinae is regarded as particularly poor. Based on species numbers known from other countries in Europe, a conservative estimate is 700–800 species of Cecidomyiidae actually occurring in Finland.

Keywords

Gall midges, Finland, species list

Introduction

With a world total of more than 6200 species described, Cecidomyiidae are among the largest families of Diptera, although adult cecidomyiids are mostly delicate midges with body lengths of less than 5 mm. The family has been catalogued (Gagné and Jaschhof 2014) and that publication provides bibliographic and other information on all known species. Six subfamilies are recognised: the fungivorous Catotrichinae, Lestremiinae, Micromyiinae, Winnertziiinae and Porricondylinae, and the mostly herbivorous Cecidomyiinae. The latter subfamily, which also includes fungivores and predators, comprises the largest gall-making group of insects (hence the family name that translates as gall midges).

In the fungivorous subfamilies, many larvae are associated with dead wood, rendering those a biodiverse, albeit little studied group of saproxylic insects. In Cecidomyiinae, larvae associated with living flowering plants are usually restricted to development on one, or a few closely-related host species; predators are also generally assumed to be highly host-specific, as far as is known.

The Palaearctic has more named Cecidomyiidae species than any other zoogeographical region, and the best known gall midge fauna is that of Europe, with more than 1800 species (Skuhravá 2006). Even so, European Cecidomyiidae are far from being completely known, and the Finnish fauna provides a good example. To illustrate, while the previous checklist of Finnish Cecidomyiidae (Hackman 1980) comprised only four species of Lestremiinae and Micromyinae, a recent taxonomic study increased that number to 162, including 34 new species (Jaschhof and Jaschhof 2009). As for Winnertziiinae and Porricondylinae, 27 species in Hackman's (1980) list compare with 69 species recorded here (Penttilinen and Siitonens 2005, Penttilinen and Spungis 2007, Penttilinen and Jaschhof 2009; Jaschhof, unpublished; Penttilinen, unpublished), yet much remains to be discovered, as is testified by specimens in the Penttilinen Collection belonging to a number of unnamed species. In Cecidomyiinae, only three species (Hulden 2003; Skuhravá, unpublished) are here added to the Hackman list, a meager increase that is obviously explained by the slight research effort in recent years.

Identification of cecidomyiids, both larvae and adults, is generally difficult and usually left to a few taxonomic specialists of the family. An adult key to the Palaearctic genera of Cecidomyiidae was provided by Skuhravá (1997); to the Holarctic genera of Lestremiinae and Micromyinae by Jaschhof and Jaschhof (2009), and to the Holarctic genera of Winnertziiinae and Porricondylinae by Jaschhof and Jaschhof (2013). Adult keys and illustrations by Jaschhof and Jaschhof (2009, 2013) can be used to identify the Finnish species of the fungivorous subfamilies. Adult keys to identify species of Cecidomyiinae in Finland are only available for a few small groups, so any attempts in this regard rely largely on descriptions and illustrations scattered in an extensive literature. In general, many Cecidomyiinae species cannot be identified unless a bundle of information (regarding host, gall, immature stages, adults of both sexes) are known. Illustrated keys to galls, including those caused by gall midges, have been published for Central and Northern Europe by Buhr (1964, 1965), a resource that is currently being revised and updated for publication in English in 2015 (see <http://www.pflanzengallen.de>).

The arrangement of taxa in this list largely follows the recent edition of the world catalogue (Gagné and Jaschhof 2014) except that genera are here arranged under their pertinent tribes and supertribes, if known. All Finnish records of species of the fungivorous subfamilies were revised in recent years (Jaschhof and Jaschhof 2009, 2013; Penttilinen, unpublished), so can be related to actual voucher specimens deposited in museum collections. The list of Cecidomyiinae, which is not updated to the same extent, is compiled from published locality records based on varying evidence, including galls alone.

Number of species:

World: 6203 species (Gagné and Jaschhof 2014)
Europe: 1800 species (Skuhravá 2006)
Finland: 356 species (this paper)
Faunistic knowledge level in Finland: poor

Abstract

A checklist of the 'fungus gnat' group of families in Sciaroidea: Bolitophilidae, Diadocidiidae, Ditomyiidae, Keroplatidae and Mycetophilidae (Diptera) recorded from Finland. At present, the known Finnish fauna comprises 767 recognized species in 78 genera; 21 species of the family Bolitophilidae, 5 of the family Diadocidiidae, 2 of the family Ditomyiidae, 47 of the family Keroplatidae and 692 of the family Mycetophilidae. The unassigned genus *Sciarosoma* Chandler, 2002 is not included in this paper because it is listed with Sciariidae.

The most relevant synonyms, on which species were ever listed from Finland in Hackman (1980) and subsequent authors are indicated in the checklist. Eighteen species names of wrong records were removed.

Keywords

Species list, Finland, Diptera, biodiversity, faunistics

Introduction

Fungus gnats are a rich assemblage of nematocerous flies (Diptera, Nematocera) placed in the infraorder Bibionomorpha and superfamily Sciaroidea, currently divided into eight families (Blagoderov and Grimaldi 2004). Five of these families (Bolitophilidae, Diadocidiidae, Ditomyiidae, Keroplatidae and Mycetophilidae) are called informally

‘fungus gnats’ by most European authors. Species in these families are morphologically closely related and the group is also ecologically uniform.

Adults of fungus gnats are generally quite easily recognized by their habitus. They are slender to moderately robust flies between 2 and 10 mm (a few up to 15 mm) in body length, with long antenna, a high and often strongly arched thorax made distinctly higher by the long, stout and tight-sitting coxae of their legs. Their wings have reduced and variable venation that is quite distinctive for the different families and much used also to classify genera. Their body and legs are often covered with strong bristles. As larvae the majority of fungus gnat species are mycetophagous, associated with fungi, either fruiting bodies or mycelia in dead wood and soil litter.

Here I cover all the Finnish fungus gnat fauna of the families Bolitophilidae, Diadocidiidae, Ditomyiidae, Keroplatidae, and Mycetophilidae. In Europe, the superfamily Sciaroidea further includes two large families, the Sciaridae – black-winged fungus gnats and the Cecidomyiidae – gall midges (Søli et al. 2000) although some authors, e.g. Hippa and Vilkamaa (2006) consider the Cecidomyiidae as the sister group of all other Sciaroidea. They differ markedly in habitus and larval biology and are presented elsewhere. Finally, the unassigned genus *Sciarosoma* Chandler, 2002 is not included in this checklist since it is listed with the family Sciaridae according Hippa and Vilkamaa (2006), but see also opinion by Jaschhof et al. (2006).

Systematics and nomenclature of the enumeration follow the online checklist of Nordic fungus gnats (Kjærandsen 2012). Only the most relevant synonyms, on which species were ever listed from Finland, are included in the checklist.

Adults of the North European species can largely be identified using Hutson et al. (1980) and Zaitzev (1994) – Bolitophilidae, Diadocidiidae, Ditomyiidae, Keroplatidae, and Mycetophilidae in part (Mycomyiinae, Sciophilinae, Gnoristinae and Leiiinae), and Zaitzev (2003) – Mycetophilidae in part (Mycetophilinae and Manotinae). However, since many new taxa are added, and corrections, synonyms and revisions continually published, one needs a complete set of the fragmented taxonomic literature to cover all the species. A good source for obtaining most important literature on the Sciaroidea is the ViBrant/Scratchpad module Fungus Gnats Online (2014). Species identification of fungus gnats based on examination of larvae is currently impossible because the larvae seemingly lack unique morphological characteristics and search for species-specific molecular markers are yet to be implemented.

Fungus gnats are distributed all over the world with about 5,300 known species (Table 1), more than 1,450 of them are known from the Palaearctic region (Søli et al. 2000). According to the current version of the Fauna Europaea Web-database (Chandler 2004), 1,098 species of fungus gnats had then been recorded from Europe. Taking into account literature published subsequently these figures could be increased in ca 100 additional species, i.e. some 1,200 species are known in Europe at present. As opposed to many other insect groups, fungus gnats, at least Mycetophilidae, seem to display an increasing diversity towards the north in Europe, and in the European perspective, they are especially diverse in the boreal zone. The current version of the checklist of North European (Sweden, Norway, Finland, Russian Karelia, Russian Lapland, Denmark, The Faroes, and Iceland) fungus gnats (Kjærandsen 2012) includes 896 species.

Table 1. Number of species by family.

Family	Number of species (except <i>Sciarosoma</i>) in				Level of knowledge
	World (Pape et al. 2011)	Europe (Chandler 2004)	Nordic Region (Kjærandsen 2012)	Finland	
Bolitophilidae	59	36	31	21	average
Diadocidiidae	34	5	5	5	average
Ditomyiidae	94	4	3	2	average
Keroplatidae	953	110	62	47	average
Mycetophilidae	4150	942	794	692	average

In Finland, 269 species of the fungus gnats (of which ca. 40 currently recognized species were described by Carl Lundström) were first listed in the Enumeration Insectorum Fenniae (Frey et al. 1941). Hackman (1980) presented the second checklist of Finnish Diptera that incorporates 486 species of fungus gnats including five with a question mark. This list of species, with minor additions and corrections concerning Mycetophilidae after systematical revisions of the genera *Trichonta* (Gagné 1981) and *Mycomya* (Väisänen 1984) in the Holarctic region was included into Catalogue of the Palaearctic Diptera (Hackman et al. 1988). During the recent two decades, large-scale inventories (e.g. Polevoi and Jakovlev 2004, Polevoi et al. 2006, Jakovlev et al. 2006, 2014, Jakovlev and Penttinen 2007) have increased the total number of Finnish fungus gnats with ca. 300 species. The 2010 Finnish Red List assessment of fungus gnats was based on a regional species pool consisting on 734 species (Penttinen et al. 2010). At present, the Finnish fungus gnat fauna incorporates 767 recognized species (except *Sciarosoma*) and ca. 20 species awaiting descriptions. Altogether, 18 species names of wrong records from Finland were removed from the checklist. These species and 3 doubtful species names are listed in the end.

Excluded species

Bolitophilidae
Bolitophila spinigera Edwards, 1925 misidentified

Keroplatidae
Macrocera nigropicea Lundström, 1906 not found within present borders
Macrocera sudetica Landrock, 1924 only females, unidentifiable (see Notes)
Orfelia bicolor (Macquart, 1826) only females, unidentifiable (see Notes)

Mycetophilidae

Allodia triangularis (Strobl, 1895) misidentified*Cordyla styliforceps* (Bukowski, 1934) misidentified (see Notes)*Exechiopsis unguiculata* (Lundström, 1911) not found within present borders*Leptomorphus quadrimaculatus* Matsumura, 1916 misidentified (see Notes)*Monoclonia mikii* Kertesz, 1898 misidentified (see Notes)*Mycetophila gratiosa* Winnertz, 1864 misidentified (see Notes)*Mycetophila lunata* Meigen, 1804 misidentified (see Notes)*Mycetophila vittipes* Zetterstedt, 1852 misidentified (see Notes)*Palaeodoscia alpicola* (Strobl, 1895) misidentified (see Notes)*Pseudexechia trisignata* (Edwards, 1913) not found within present borders*Pseudorymosia optiva* (Dziedzicki, 1910) misidentified (see Notes)*Sciophila hebes* Johannsen, 1910 misidentified (see Notes)*Synplasta excogitata* (Dziedzicki, 1910) misidentified (see Notes)*Trichonta fidelis* Gagné, 1981 mistake (see Notes)**Notes**

***Cordyla styliforceps* (Bukowski, 1934)** was added to the list of Finnish insects by Silfverberg (2007) with a reference to Polevoi (2001) which most probably based on misidentified species (A.Polevoi, pers. comm).

***Leptomorphus quadrimaculatus* Matsumura, 1916** was added to the list of Finnish insects by Silfverberg (2001) with a reference to Polevoi (1995). This record has later shown to belong to *Leptomorphus subforcipatus* (Zaitzev and Ševčík 2002).

***Macrocerca sudetica* Landrock, 1924** and ***Orfelia bicolor* (Macquart, 1826)** (= *basalis* Winnertz, 1864). Listed in Hackman (1980) by the only female specimen located in the collection of the Finnish Museum of Natural History “Diptera Fennica” that cannot be recognised. No further records from Finland.

***Monoclonia mikii* Kertesz, 1898.** Listed in Hackman (1980) by erroneously identified male specimen of *Monoclonia braueri* and by the female specimen (both are located in “Diptera Fennica”) that cannot be recognized. Later this species has been recorded from Finland under its valid name, *Monoclonia silvatrica* (Jakovlev et al. 2014).

***Mycetophila gratiosa* Winnertz, 1864.** Listed in Hackman (1980) by erroneously identified male specimens of *Mycetophila luctuosa* located in “Diptera Fennica”.

***Mycetophila lunata* Meigen, 1804** was interpreted broadly in old sources, and although it was confirmed by Silfverberg (2001) with a reference to Polevoi (1995) this record has later shown to belong to another related species, *M. sublunata* Zaitzev, 1999. Hence, *M. lunata* still needs to be confirmed from Finland.

***Mycetophila vittipes* Zetterstedt, 1852.** Listed in Hackman (1980) by erroneously identified male specimens of *Mycetophila vittipes*-group located in “Diptera Fennica”.

***Palaeodoscia alpicola* (Strobl, 1895)** Listed in Hackman (1980) by erroneously identified male specimen of *P. vittata* located in “Diptera Fennica”.

***Pseudorymosia optiva* (Dziedzicki, 1910).** The small genus *Pseudorymosia* contains only two known Palaearctic species, *P. fovea* (Dziedzicki, 1910) and *P. optiva* (Dziedzicki, 1910), that in fact might be only one species (Zaitzev 2003). Re-examination of specimens in the “Diptera Fennica” collections formerly identified as *P. optiva* and published by Hackman (1980) revealed that all of them are in fact the widely distributed *P. fovea* as interpreted in newer determination sources (Jakovlev et al. 2006).

***Sciophila hebes* Johannsen, 1910.** Recorded by Komonen (2001) by erroneously identified specimens of *Sciophila antiqua*.

***Synplasta excogitata* (Dziedzicki, 1910).** Listed in Hackman (1980) by erroneously identified male specimen of *Synplasta gracilis*.

***Trichonta fidelis* Gagné, 1981.** Listed in Hackman (1980) with the note that *T. fidelis* Gagné was only a manuscript of Gagné (1981) at the time. Apparently Gagné changed his mind before publication and used this name for an oriental species instead (Hackman 1982).

***Zygomyia semifusca* (Meigen, 1818).** Listed in Hackman (1980) as *Mycetophila semifusca*.

Doubtful and unrecognized species

* ***Keroplatus tuvensis* Zaitzev, 1991.** This species might be a junior synonym of *Keroplatus testaceus* (Kjærandsen et al. 2007). With this reference, it was deleted from the list of Finnish insects by Silfverberg (2012), but this synonym has not been adopted in the checklist of North European fungus gnats (Kjærandsen 2012). Hereby we keep *K. tuvensis* in the Finnish checklist pending revision of the *K. testaceus* complex of species.

* ***Mycetophila biformis* Maximova, 2002** preocc. Added by Jakovlev et al. (2014). This is a junior primary homonym of *Mycetophila biformis* Duret, 1992. A replacement name will be given by the author in the near future (Yulia Maximova, pers. comm.).

* ***Trichonta tristis* (Strobl, 1898).** Judging from illustration of Dziedzicki (1889), he actually illustrated this species as *Trichonta vulcani*. This makes *vulcani* a junior synonym of *tristis*. In this case, *Trichonta trifida* Lundström, 1909 becomes the valid species that we now call *vulcani* (J. Kjærandsen, pers. comm.). Here we list *T. vulcani* and *T. tristis* as valid species sensu Zaitzev (2003), figures 107,1 and 109,5.

Species listed by Hackman (1980) with a question marks

Five species, ***Docosia flavicoxa* Strobl, 1900**, ***Cordyla bergensis* (Barendrecht, 1938)**, ***Cordyla murina* Winnertz, 1864**, ***Mycetophila lunata* Meigen, 1804** and ***Phronia petulans* Dziedzicki, 1889** were listed in the former checklist of Finnish Diptera (Hackman 1980) with a question marks. Later, Finnish records were confirmed for *D. flavicoxa* by Jakovlev et al. (2014), for *C. murina* by Jakovlev et al. (2006), and for *P. petulans* by Jakovlev and Polevoi (2009). *Cordyla bergensis* was excluded as a junior synonym of *Cordyla nitidula* (Jakovlev et al. 2006). *Mycetophila lunata* – see above.

Acknowledgements

The author thanks Dr. Jukka Salmela (Finland) who has discovered tens of fungus gnat species new to Finland resulting from his studies of under recorded fauna of wetlands, mires and forests along brooks in northern boreal and oroarctic zones of Finnish Lapland. Jere Kahanpää and Dr. Jukka Salmela, the editors of the Checklist of Finnish Diptera, Dr. Jostein Kjærandsen (Norway), the editor of the online checklist of Nordic fungus gnats (Kjærandsen 2012), Dr. Pekka Vilkamaa (Finland), and two referees: Dr. Jukka Salmela and Dr. Alexei Polevoi (Petrozavodsk, Russia) are thanked for useful comments on the manuscript.

Abstract

A checklist of the family Sciaridae (Diptera) recorded from Finland is provided. The genus *Sciarosoma* Chandler with a disputed family placement is also included in the list.

Keywords

Checklist, Finland, Diptera, Sciaridae, *Sciarosoma*

Introduction

Sciaridae, the black fungus gnats, is one of the large families in Sciaroidea, little studied and notoriously difficult in its taxonomy. Up-to-date keys are not available for all European species, but various publications must be consulted for identification. Our knowledge of Finnish fauna stems from two classic publications: Frey (1948) and Tuomikoski (1960) but Menzel and Mohrig (2000) made fundamental nomenclatorial changes in their study of the type materials of all Palearctic species.

As no records of Sciaridae in Finland were published between the publication of Tuomikoski's (1960) monograph on the family and Hackman's (1980) check-list

of Finnish nematoceran Diptera, the species lists in both works are essentially unchanged, despite some obvious lapses in the latter. Our knowledge of Finnish fauna has since grown mainly in the taxonomic treatment of various genera and species groups (see Vilkamaa et al. 2013). All species recorded in Finland in publications thus far, besides the most recent ones, appear in H. Silfverberg's compilations of changes to the Finnish insect fauna published every five years (for the latest one, see Silfverberg 2012).

With regard to nomenclature and generic classification, the present list follows the revisions of Menzel and Mohrig (2000) and Mohrig et al. (2013), although on the basis of phylogenetic analyses *Baeosciara* Tuomikoski, *Dolichosciara* Tuomikoski, *Peyerimhoffia* Kieffer, *Prosciara* Frey and *Mouffetina* Frey are regarded as genera (see Vilkamaa 2000, 2003, Vilkamaa and Hippa 2005, Shin et al. 2013). For names currently understood as junior synonyms, mostly only the names listed as valid in Tuomikoski (1960) are mentioned. For complete synonym lists, one can consult Menzel and Mohrig (2000) and Mohrig et al. (2013). Although some genera can be regarded as relatively well-known for the Finnish species they contain, for some others, such as the species-rich *Bradyzia* Winnertz, many new species including undescribed ones may be present in the native fauna. Even so, together with Germany, Sweden and the United Kingdom, Finland can be considered one of the countries best known for its sciarid fauna.

Number of species:

World: 2600 species

Europe: 700 species

Finland: 338 species

Faunistic knowledge level in Finland: average

Abstract

A checklist of the ‘lower Brachycera’ of Finland is presented. This part of the complete checklist of Finnish Diptera covers the families Acroceridae, Asilidae, Athericidae, Bombyliidae, Mythicomyiidae, Rhagionidae, Scenopinidae, Stratiomyidae, Tabanidae, Therevidae, Xylomyidae and Xylophagidae.

Keywords

Species list, Finland, Diptera, biodiversity, faunistics

Introduction

This part of the checklist of the Diptera of Finland covers non-eremoneuran true flies (Diptera: Brachycera). The brachyceran flies excluded from the clade Eremoneura are often called the ‘lower Brachycera’ due to their basal position in the true fly tree of life. It remains unclear whether this assemblage of families is a monophyletic clade. There are also several models for the relative relationships of the various superfamilies and families. A simple classification scheme following Marshall (2012) is adopted for this

checklist. Only two infraorders, Tabanomorpha and Asilomorpha, are recognized. The presentation order of families follows Woodley et al. (2009).

World catalogues have recently been published for Stratiomyidae (Woodley 2001, 2011b), Xylomyidae (Woodley 2011a), Xylophagidae (Woodley 2011c), Bombyliidae (Evenhuis and Greathead 1999, 2003) and Mythicomyiidae (Evenhuis 2002). The Finnish species were last listed by Kahanpää and Winqvist (2005). Five species have been added since the last checklist: *Haematopota italica* Meigen, 1804, *Lasiopogon septentrionalis* Lehr, 1984, *Nemotelus infortunatus* Kahanpää, 2010, *Xylophagus inermis* Krivosheina & Krivosheina, 2000 and *Zabracchia tenella* (Jaennicke, 1866) (see Kahanpää 2013, Cannings and Kahanpää 2013, Kahanpää 2010, this paper, and Krivosheina and Rozkošný 1990 respectively). Table 1 summarizes the current family species counts for the world, Europe (based on Fauna Europaea), and Finland.

Tabanomorpha

The stratiomyoid and xylophagoid lineages are often treated as infraorders (Woodley et al. 2009).

The soldierflies (Stratiomyidae) are very diverse in the tropics but the species diversity decreases sharply towards the higher latitudes. The wood soldier flies (xylomyids) is a small fly family associated with dead wood. The Fauna Entomologica Scandinavica series has a volume on stratiomyoid flies (Rozkošný 1973). A new *Nemotelus* species was recently described from Finland (Kahanpää 2010a).

The Finnish rhagionids are relatively well known but a few additional species could occur in the country. *Ptiolina* is a problematic genus and the number of recognized species in Northern Europe has varied from two to seven during the last century. Athericidae was traditionally placed as a subfamily of Rhagionidae, but it seems more closely associated with Tabanidae (Marshall 2012). Itämies et al. (1990, 1993) have studied the distribution of *Atherix ibis* in Finland.

The Finnish xylophagid fauna is relatively well sampled. Adults of the North European species can be identified using Nartshuk (1988) or Kahanpää (2009). The larvae can also be identified at least at the last larval stage (Stubbs and Drake 2001, Krivosheina and Krivosheina 1966).

The tabanid nomenclature (especially *Hybomitra*) is quite convoluted and records in older publications must be taken with a grain of salt. Karvonen (1969) summarized the distribution of tabanids in Finland, but this work is now partially obsolete due to the difficulties in identifying *Hybomitra* and *Haematopota* before Chvála et al. (1972) was published. For identification of North European tabanids Chvála et al. (1972) complemented with pictures in Zeegers and van Haaren (2000) or Krčmar et al. (2011) is recommended. An illustrated guide to the Finnish species is in preparation (A. Haarto, unpublished).

Table 1. Number of species in tabanomorph and asilomorph families plus Acroceridae.

Family	Number of species in World			Level of knowledge
		Europe	Finland	
<i>Tabanomorpha:</i>				
Stratiomyidae	2715 (Woodley 2001, 2011b)	141	29	good
Xylomyidae	138 (Woodley 2011a)	13–14	1	good
Xylophagidae	134 (Woodley 2011c)	8	5	average–good
Rhagionidae	694 (Pape et al. 2011)	85	15–16	average–good
Athericidae	124 (Pape et al. 2011)	10	1	good
Tabanidae	4405 (Pape et al. 2011)	213	38–39	good
<i>Asilomorpha:</i>				
Asilidae	7513 (Pape et al. 2011)	524	35	good
Bombyliidae	~5000 (Evenhuis and Greathouse 1999, 2003)	335	18–19	good
Mythicomyiidae	~330 (Evenhuis 2002, Pape et al. 2011)	30	1	average
Scenopinidae	416 (Pape et al. 2011)	17	3	good
Therevidae	1129 (Pape et al. 2011)	99	17	average–good
<i>unplaced:</i>				
Acroceridae	392 (Pape et al. 2011)	34	5	average

Asilomorpha

The asilids and bombyliids of Finland are rather well known from a faunistic point of view but little is known about their ecology. Most of the North European species are easy to identify but problems with *Villa* resulted in a cascade of name changes in the late 20th century. Falck (2009) and Blöchliger (2008) are good starting points for identifying *Villa* adults. François (1969) has male genitalia figures for some of the more difficult *Villa* species. The Mythicomyiidae or micro bee flies were long seen as a subfamily of Bombyliidae.

Identifying *Thereva* species was also fraught with difficulties in the past but by the end of the 20th century the North European fauna was pretty well understood. A review of the Finnish therevid fauna with keys has recently been published (Haarto and Winqvist 2006). The window flies, Scenopinidae, is a smallish asiloid lineage associated with the therevids. It has even been proposed they are a specialized subgroup of the Therevidae (Woodley 2009).

Acroceridae

The small-headed flies (Acroceridae) are a fly family of obscure origin. Affinities with Nemestrinidae, Tabanoidea, Stratiomyoidea, Bombyliidae and Asilomorpha have been proposed (see Marshall 2012 for further discussion). Finnish acrocerid records are mostly of single adults caught by sweep-netting, although Storå (1956) found groups of 20–40 *Acrocera orbicularis* swarming on a coastal meadow. The acrocerid species seem to have declined in abundance during the 20th century. Four of our five Finnish species are now on the national red list (Kahanpää 2010b).

Notes

***Choerades ursulus* (Loew, 1851)** is a poorly known taxon. It was synonymized with *C. fuliginosus* by Lehr (1991) but later considered valid by Bosák and Hradský (2001). Kahanpää and Winqvist (2005) accepted it as a Finnish species but upon re-examination we consider it most likely that the single Finnish specimen previously identified as *C. ursulus* is a dark male of *C. fuliginosus*.

***Chrysopilus suomianus* (Szilády, 1934).** The type locality of this species is Enontekiö, Finland (Szilády 1934). Unfortunately the type material seems lost and the name is probably best treated as a *nomen dubium*. Based on Szilády's original description it may be a dark form of *C. nubecula*.

***Hybomitra astuta* (Osten Sacken, 1876).** Kahanpää and Winqvist (2005) could not locate any material in Finnish collections. Several new records of this species have since been made and its presence in Finland is now confirmed.

***Hybomitra auripila* (Meigen, 1820).** The synonymy of *Hybomitra auripila* (Meigen, 1820) with *H. aterrima* (Meigen, 1820) was established by Schacht (1994) and is accepted here. Schiner (1862) already mentioned *H. aterrima* as synonym to *H. auripila*. Since we consider him to be the first revisor, the name *H. auripila* is valid under the current Code.

***Hybomitra solstitialis* (Meigen, 1820)** has long been known to be a problematic taxon. It is separated from *H. bimaculata* (Macquart, 1826) based on color characters alone. The examined Finnish material includes a range of intermediates between typical *H. bimaculata* and *H. solstitialis* forms. It seems likely that the two names are synonymous, but types should be consulted before synonymy is formally published.

***Haematopota subcylindrica* Pandellé, 1883.** First recorded from Finland by Vuorimies (1984). Unfortunately the specimens listed in his paper could not be found and their identification remains somewhat doubtful.

Ogcodes borealis Cole, 1919. A single Finnish specimen collected in the mid-19th century is the sole Palearctic record of this species. Originally identified and published by Hackman (1970), the record was later confirmed by Kahanpää and Winqvist (2005). *O. borealis* Cole *sensu* Schlinger (1960) may be a species complex.

Ogcodes nigripes (Zetterstedt, 1838) is probably a senior synonym of *O. zonatus* Erichson, 1840.

Ptiolina nigrina Wahlgren, 1854 may be a synonym of *P. nigra* Zetterstedt, 1842.

Scenopinus sp. A is an apparently undescribed species near *S. fenestralis* with black femora. It occurs widely in Finland in association with bird nests.

Villa halteralis (Kowarz, 1883). See Kahanpää and Winqvist (2005) for a discussion of the single supposed Finnish record of this species.

Xylophagus ater Meigen, 1804. This name has widely been used for two species. Old Finnish checklists (Frey *et al.* 1941, Hackman 1980) followed the model also used in the world checklist Woodley (2011c) and used this name for the species also known as *Xylophagus kowarzi* (Pleske, 1925). On the British Isles the name *X. ater* is used as a senior name for *X. compeditus* Wiedemann in Meigen, 1820. According to Alexander and Clements (1991) and Chandler (1998a, b) the British usage is correct and it is followed here. Thus, *X. ater* is the common species with females easily identified by the three stripes of dusting on the mesonotum.

Xylophagus inermis Krivosheina & Krivosheina, 2000 was described as a subspecies of *X. matsumurae* Miyatake, 1965 = *maculatus* Matsumura, 1916 (preoccupied by *X. maculatus* Meigen, 1804) (Krivosheina and Krivosheina 2000). It was raised to a full species status in the recent world catalogue (Woodley 2011c). All collected Finnish specimens formerly identified as *X. matsumurae* were examined and they belong to *X. inermis*.

Zabracchia tenella (Jaennicke, 1866). First recorded from Finland by Krivosheina and Rozkošný (1990). We have examined the Finnish *Zabracchia* material and confirmed the presence of both *Z. tenella* and *Z. minutissima* in the country.

Abstract

An updated checklist of the Atelestidae, Brachystomatidae, Dolichopodidae, Empididae and Hybotidae (Diptera) recorded from Finland is presented. The genera with uncertain placement within superfamily Empidoidea (= the *Iteaphila* group) are also included in this paper.

Keywords

Checklist, Finland, Diptera, Atelestidae, Brachystomatidae, Dolichopodidae, Hybotidae, Empididae

Introduction

Empidoidea (dance flies and long-legged flies) is one of the most diverse lineages of Diptera with some 13,000 species currently recognized worldwide (Pape et al. 2011) and many more still undescribed. The superfamily is generally accepted as monophyletic, but its subdivision into families, subfamilies and tribes is still being debated.

The families Atelestidae, Brachystomatidae, Hybotidae and Empididae were traditionally all included in Empididae *sensu lato*. Chvála (1983) split the empidids into five

Table 1. Number of species by family.

Family	Number of species in			Level of knowledge
	World (Pape et al. 2011)	Europe	Finland	
Atelestidae	11	4	2	average
Brachystomatidae	147	13	4	average
Dolichopodidae	7235	790	260	good
Hybotidae	1972	442	143–144	average
Empididae	3049	803	175	average

families: Empididae *sensu stricto*, Hybotidae, Atelestidae, Dolichopodidae and Microphoridae. Sinclair and Cumming (2006) analyzed the whole superfamily Empidoidea, elevated Brachystomatidae to a full family and transferred Microphorinae to the long-legged flies (Dolichopodidae). Two of the Finnish genera, *Anthevisorius* Becker and *Iteaphila* Zetterstedt, remain unassigned on family level (Sinclair and Cumming 2006, Shamshev and Sinclair 2009). The classification proposed by Sinclair and Cumming (2006) is adopted for this checklist.

The world fauna of the Empidoidea has recently been catalogued by Yang et al. (2006, 2007). The Finnish species were last listed by Kahanpää and Winqvist (2005) for Atelestidae, Brachystomatidae, Hybotidae and Empididae (plus Microphorinae) and by Kahanpää and Grichanov (2004) for Dolichopodidae. Two updates to the dolichopodid checklist have since been published (Kahanpää 2006, 2013).

Excluded species

- Chelifera astigma* Collin, 1927 misidentified
- Chrysotus arcticus* Frey, 1915 not found within present borders
- Chrysotus longipalpus* Aldrich, 1896 imported
= *pallidipalpus* van Duzee, 1933
- Chrysotus ringdahli* Parent, 1929 not found within present borders
- Clinocera nigra* Meigen, 1804 misidentified
- Crossopalpus abditus* Kovalev, 1972 not found within present borders
- Dolichopus angustipennis* Kertesz, 1901 not found within present borders
= *adustus* Frey, 1915
- Dolichopus grandicornis* Wahlberg, 1850 not found within present borders
- Dolichopus mediicornis* Verrall, 1875 not found within present borders
- Dolichopus plumitarsis* Fallén, 1823 misidentified
- Dolichopus propinquus* Zetterstedt, 1852 misidentified
- Drapetis incompleta* Collin, 1926 misidentified
- Empis punctata* Meigen, 1804 not found within present borders
- Gymnopternus assimilis* (Staeger, 1842) misidentified
- Hilara flavipes* Meigen, 1822 misidentified
- Hilara maura* (Fabricius, 1776) not found within present borders
- Hilara scrobiculata* Loew, 1873 misidentified
- Hilara tetragramma* Loew, 1873 misidentified
- Hydrophorus balticus* (Meigen, 1824) not found within present borders
- Hydrophorus ponojensis* Frey, 1915 not found within present borders
- Iteaphila furcata* (Zetterstedt, 1842) not found within present borders
- Medetera annulitarsus* von Roser, 1840 misidentified
- Medetera glauca* Loew, 1869 misidentified
- Medetera feminina* Negrobov, 1967 misidentified
- Medetera truncorum* Meigen, 1824 imported
- Oedalea flavipes* Zetterstedt, 1842 misidentified
- Parathalassius krogerusi* Frey, 1927 nomen nudum
- Rhamphomyia tibialis* Meigen, 1822 misidentified
- Rhaphium antennatum* (Carlier, 1835) misidentified
- Rhaphium obscuripes* Zetterstedt, 1849 misidentified
- Rhaphium suave* (Loew, 1859) not found within present borders
- Tachytrechus insignis* (Stannius, 1831) misidentified
- Trichoclinocera lapponica* (Ringdahl, 1933) not found within present borders

Notes

***Dolichopus caligatus* Wahlberg, 1850** was synonymized with *D. flavipes* Stannius, 1831 by Becker (1918) but Collin (1940) reinstated *D. caligatus* as a valid species.

True *D. flavipes* (if it is a valid species) has not been found in Finland but some specimens have been recorded from Northwestern European Russia.

***Dolichopus stenhammari* Zetterstedt, 1843.** Zetterstedt (1838) first described this species as *Dolichopus annulipes*. Later he proposed *D. stenhammari* Zett., 1843 as an (unnecessary) replacement name for the taxon: *Porphyrops annulipes* Meigen, 1824 was recognized in *Dolichopus* at the time, but only as a junior synonym of what is now *Sympycnus pulicarius* (Fallén, 1823) (Zetterstedt 1843). Nonetheless this act means, according to article 59.3 of The Code (ICZN 1999), that *D. annulipes* Zett., 1838 is permanently invalid.

***Hilara pseudochorica* Strobl, 1892.** Erroneously deleted from the Finnish checklist by Kahanpää and Winqvist (2005).

***Iteaphila furcata* (Zetterstedt 1842).** Sinclair and Shamshev (2012) list a specimen from Kuusamo with code label 1546. According to R. Frey's notes this specimen was collected in 1917 from eastern Kuusamo, an area ceded to Russia in 1944.

***Neurigona* sp. A** is probably *N. uralensis* Becker, 1918.

***Platypalpus articulatus* and *P. maculimanus*.** According to Allen (1986) these two names are not synonymous and the species identified as *P. articulatus* Macquart by Chvála (1975, 1989) is in fact *P. maculimanus* (Zett.). Upon re-examination, all Finnish material previously identified as *P. articulatus* belonged to *P. maculimanus* and *P. articulatoides* Frey. It remains unclear whether the real *P. articulatus* occurs in Finland.

***Rhaphomyia* sp. nr. *albibennis*.** An apparently undescribed species near *R. albipennis* (Fallén, 1816) (K. Winqvist & M. Barták, priv. comm.).

***Sympycnus pulicarius* (Fallén, 1823).** Pollet (2004) (Fauna Europaea) treats *S. annulipes* (Meigen, 1824) and *S. desoutteri* Parent, 1925 as valid species and lists *S. pulicarius* (Fallén, 1823) as a synonym of the latter but notes that it might actually be a synonym of *S. annulipes*.

***Thrypticus* sp. A** is probably *T. incanus* Negrobov, 1967 described from the Leningrad Oblast, Russia (Negrobov 1967).

***Trichoclinocera lapponica* (Ringdahl, 1933).** The type locality of this species, "Lappland nära Tjuonajaure", (Ringdahl 1933) is in Sweden, not Finland as stated in Chvála and Wagner (1989).

Abstract

A checklist of the Opetiidae and Platypezidae (Diptera) recorded from Finland.

Keywords

Checklist, Finland, Diptera, Opetiidae, Platypezidae

Introduction

Opetiidae and Platypezidae are small families of small-sized flies. Platypezidae are principally forest insects, and all known larvae develop in fungi. New host fungi records were recently reported in Reemer et al. (2014), Ståhls et al. (submitted) and Ståhls and Rättel (2013).

The Finnish species were last listed by Hackman (1980) and Chandler (2001). Chandler (2001) included one and 21 species of Opetiidae and Platypezidae, respectively. Ståhls and Kahanpää (2006), Winqvist (2011), Ståhls et al. (2014), Reemer et al. (2014) and Ståhls and Rättel (2013) added altogether 12 species of family Platypezidae. *Bolopus furcatus* was included in Hackman (1980) but not in Chandler (2001), Ståhls et al. (2012) reported the taxon from Finland again. *Agathomyia* (subfamily Calloomyiinae) is the largest genus of the Platypezidae. A recent study reinstated two *Agathomyia* species from synonymy (*A. boreella* Zetterstedt and *A. scutellaris* Zetterstedt) and two species were described as new to science (Ståhls et al. submitted). The taxonomic

status of *A. dahlbomi* (Zetterstedt), presently listed as synonym of *A. elegantula* (Zetterstedt), remains unclear. *Callomyia elegans* and *Protoclythia modesta* are only known from previous single records, their occurrence has not been verified with new findings.

Chandler and Shatalkin (1998) and Chandler (2001) provided keys to subfamilies, genera and species of adult Palaearctic Platypezidae, and key to genera of known early stages of Platypezidae. Ståhls et al. (submitted) provided a key to Northern European *Agathomyia* spp.

Number of species (Opetiidae, Platypezidae):

World: 102, 252 species (Pape et al. 2011)

Europe: 1, 46 species

Finland: 1, 38 species

Faunistic knowledge level in Finland: average

Abstract

A checklist of the Lonchopteridae and Phoridae recorded from Finland is presented.

Keywords

Checklist, Finland, Diptera, Lonchopteridae, Phoridae

Introduction

The superfamily Phoroidea includes at least the fly families Phoridae, Lonchopteridae, and the small family Iromomyiidae known only from Australia. The flat-footed fly families Platypezidae and Opetiidae, treated in a separate paper in this volume, are placed either in their own basal superfamily Platypezoidea or included in Phoroidea (see Cumming et al. 1995, Woodley et al. 2009 and Wiegmann et al. 2011).

Lonchoptera Meigen, 1803 is the only currently recognized genus in Lonchopteridae. Five *Lonchoptera* species have been added to the Finnish fauna after the checklist of Hackman (1980) (Andersson 1991, Kahanpää 2013).

The scuttle flies (family Phoridae) may be the largest single family in Diptera. The true number of species in this family has been estimated to be over 30000, the vast majority still undescribed (Marshall 2012). The ‘megagenus’ *Megaselia* Rondani, 1856 contains about

50% of the species (Marshall 2012). Other phorid genera are relatively better known in Finland but none of them can be called well studied. It is likely that at least a hundred (or hundreds of) Finnish species remain unnoticed, most of them in *Megaselia*.

The checklist for *Megaselia* is mostly based on previously published records. The collections of Finnish Museum of Natural History (MZH) were examined by the author during the preparation of this checklist and a few obvious mistakes were taken into account. Most of the material in MZH was identified by H. Schmitz (between years 1915 and 1940) or E. Beyer (in 1958). The lists for other phorid genera are based on recently examined specimens from both MZH and private collections. Due to the difficulties encountered in identifying *Megaselia*, the list for this genus should definitely be considered preliminary. A revision of the Finnish material is sorely needed.

The Finnish species of these families were last listed by Hackman (1980).

Number of species (Lonchopteridae, Phoridae):

World: 63, 4105 species (Pape et al. 2011)

Europe: 13, 656 species

Finland: 8, ~224–234 species

Faunistic knowledge level in Finland: good, poor

Excluded species

Megaselia cirriventris Schmitz, 1929 mistake?
Megaselia crassipes (Wood, 1909) misidentified
Megaselia digitalis Schmitz, 1957 mistake?
Megaselia indifferens (Lundbeck, 1920) not found within present borders
Megaselia laponica Schmitz, 1928 not found within present borders
Megaselia luteipes (Schmitz, 1918) misidentified
Megaselia palmeni (Becker, 1901) not found within present borders
Megaselia septentrionalis (Schmitz, 1919) not found within present borders
Megaselia simulans (Wood, 1912) not found within present borders ?
Triphleba gilvipes Schmitz, 1943 not found within present borders

Notes

Conicera tarsalis, *Megaselia collini*. Records of these species are based on single females identified by H. Schmitz.

Megaselia basispinata, *M. miki*, *M. raetica*. Species recorded from Finland by Hackman (1980) and Disney (1991) but no Finnish specimens or published records with details could be located.

Megaselia cirriventris, *M. digitalis*. These species were recorded from ‘Fennia’ and ‘Lapland’ by Schmitz (1958), but all specimens listed are from the Abisko region in northern Sweden. It seems likely that Schmitz erroneously assigned the material from Swedish Lapland to Finland.

Megaselia luteipes. Examined specimens belong to *Megaselia* sp. not *luteipes* (females) (Espoo, leg. W. Hackman) and possibly *Megaselia* sp. 24 of Disney (2013) (Finland, Muonio, leg. J. Sahlberg and Russia, Kola, Kantalahti, leg. R. Frey).

Megaselia pulicaria agg. This difficult complex of species was revised by Disney (1999). The Finnish material has not been re-examined. The Finnish species involved are *M. angusta*, *M. costalis*, *M. longicostalis*, *M. longifurca*, *M. pulicaria*, *M. subumida* and *M. tumida*.

Megaselia simulans. Recorded only(?) from Kuusamo, a municipality split between Finland and Russia in 1944. Most records preceding the split are from the Russian side. No material was found in MZH.

Megaselia specularis. Recorded, with some doubt, from Finland by Hackman (1963). No material could be found in MZH.

Triphleba aequalis. Schmitz (1943) mention a Finnish male stored in MZH, but no such specimen could be found.

Triphleba autumnalis, *T. inaequalis*. Finnish according to Disney (1991), but no specimens or detailed records could be located.

Abstract

A checklist of the Pipunculidae (Diptera) cited from Finland is presented. At present, 107 species have been recorded.

Keywords

Checklist, Finland, Diptera, Pipunculidae

Introduction

Pipunculidae or big-headed flies can be readily identified at family level by their large compound eyes occupying almost the entire globular head. Additional morphological autapomorphies at the family rank of this group are their enlarged anterior ommatidial facets in the female including a so far unique retinal pattern among Diptera, the piercer-like shape of the female ovipositor and the presence of a chitinized postspiracular plate of their last instar larvae (Wada 1991, Rafael and De Meyer 1992). Due to the small to medium sized adults (2–12 mm), their uniform dark appearance and their rather cryptic lifestyle, it takes some effort to detect them in the field. Therefore, Pipunculidae can best be collected by Malaise traps, although a trained eye and patience can yield species rich catches by hand-netting as well. Big-headed flies can be found in a variety of habitats, where they are hovering in between herbal vegetation or among leaves of bushes and trees, searching for food sources (mainly honeydew) and mating

partners or for suitable hosts for their parasitic larvae, which are important endoparasitoids of nymphal and adult Auchenorrhyncha (Chalarinae and Pipunculinae) and adult Tipulidae (Nephrocerinae) (Koenig and Young 2007). This highly specialized life-style is unique to this family of Diptera. Hardly any larvae have been described so far and the knowledge about their host specificity is fragmentary. For the European fauna, host records are available for 30% of the 209 known species, i.e., 62 pipunculid species have been reared from 59 host species in the past (Kehlmaier unpublished).

The knowledge of the Finnish fauna can be considered as good, with the latest review published only recently by Kehlmaier and Ståhls (2007). Whereas about a dozen additional species can be expected to be found, the distribution of the individual taxa within Finland is largely unknown.

Identification: Pipunculidae taxonomy largely depends on male genitalic features. Therefore, dissection of the male genital apparatus is essential and a high magnification of at least 50 times should be used for identification. Females can best be identified through a combination of outer anatomical features primarily based on the shape of the ovipositor. Most pipunculid genera present in Europe have been taxonomically reviewed within the past three decades. As no comprehensive key exists for northern Europe, adults have to be identified with the following set of publications: *Chalarus* (Kehlmaier and Assmann 2008, Kehlmaier 2010), *Jassidophaga* and *Verrallia* (Kuznetzov 1992, Kehlmaier 2006), *Nephrocerus* (Grootaert and De Meyer 1986), *Cephalopsini* (De Meyer 1989, Ackland 1993, Kehlmaier and De Meyer 2005, Kehlmaier 2008), *Eudorylini* (Kehlmaier 2005, Kuznetzov 1990), *Pipunculini* (Kehlmaier 2008), *Dorylomorpha* (Albrecht 1990), *Tomaszsvaryella* (Földvári and De Meyer 1999, Kehlmaier 2008).

Number of species:

World: 1428 species (Pape et al. 2011)

Europe: 209 species

Finland: 107 species

Faunistic knowledge level in Finland: good

Notes

***Chalarus argenteus* Coe, 1966.** The single Finnish specimen previously identified as *C. argenteus* was re-examined and was found to belong to *C. spurius* (Kaj Winqvist, pers. comm.).

Jassidophaga spec. A. The specimens summarised under this place holder in Kehlmaier and Ståhls (2008) might represent an additional species. Using the key in Kuznetsov (1992), males run towards the Eastern Palaearctic *J. kurilensis* (Kuznetsov, 1992), whereas females are closest to *J. beatricis*.

Abstract

A checklist of the Syrphidae (Diptera) recorded from Finland. Three species of Syrphidae, *Platycheirus modestus* Ide, 1926, *Cheilosia barovskii* (Stackelberg, 1930) and *Mallota tricolor* Loew, 1871, are published as new to the Finnish fauna. *P. modestus* is also new to the Palaearctic.

Keywords

Checklist, Finland, Diptera, Syrphidae, faunistics

Introduction

Adults of Syrphidae (hoverflies or flower flies) are mimics of bees, bumblebees, wasps and sawflies. Syrphid flies are active visitors of flowers for nectar and pollen and therefore they are important pollinators. The syrphid adults are excellent fliers and often seen hovering.

The larvae of hoverflies exploit a wide range of food sources. The majority of the species are predators and a large number of them feed on aphids. Almost half of the syrphid species are phytophagous or saprophagous. The larvae of phytophagous species tunnel in roots and stems of plants and some mine in leaves, but this rarely causes

significant economic damage. Aquatic larvae are saprophagous in decaying organic material and feed on detritus or filter bacteria. Also larvae living in dead wood and in sap runs probably filter bacteria from the decaying mass. (Marshall 2012, Van Veen 2004).

Only a few active Diptera researchers, Richard Frey, Wolter Hellén and Erkki Kanervo, studied the fauna of Finnish syrphids from the 1910s to the 1960s. They created a very good base for the knowledge of the Finnish syrphid fauna. Hackman (1980) published a list of the Finnish flies including 270 species of hoverflies. The beginning of the 2000s was an active period for faunistic research of the hoverfly fauna and the number of recorded hoverfly species had increased to 347 as the book on Finnish hoverflies (Haarto and Kerppola 2007a) was published. After that the knowledge has still been increasing thanks to working on the taxonomy and faunistics of the Finnish hoverfly fauna so that the distribution can be considered as well-known for over 90 per cent of the Finnish hoverfly species (Kahanpää 2010).

The Finnish hoverfly species were last listed by Kerppola (2013) with additions and omissions of species and with some nomenclature changes.

Identification: The Finnish syrphid fauna is best covered for identification by Haarto and Kerppola (2007a) and Bartsch (2009) although some species are missing in these books. Most of the species can be identified by external characters but some species require male genitalic characters for reliable determination.

Number of species:

World: 6015 species (Pape et al. 2011)

Europe: 830 species

Finland: 362 species

Faunistic knowledge level in Finland: good

Microdon mutabilis (Linnaeus, 1758)

Excluded species

Microdon devius (Linnaeus, 1761) was not found within present borders.

Neoascia annexa (Müller, 1776) was included in the Finnish species list in Fauna Europaea (Speight 2004). Authors have not found any specimens or publications that reliably show *N. annexa* to belong in the Finnish fauna.

Paragus punctulatus (Zetterstedt, 1838) was included in the Finnish species list in Fauna Europaea (Speight 2004). Authors have not found any specimens or publications that reliably show *P. punctulatus* to belong in the Finnish fauna.

Parasyrphus relictus (Zetterstedt, 1838): The status of *P. relictus* is unclear and the type material is lost (Speight 2013). *P. relictus* was excluded from Finnish checklist by Haarto and Kerppola (2007b).

Sphaerophoria sp. B was discovered as a deformed specimen of *Sphaerophoria laurae* Goedlin, 1989.

Temnostoma meridionale (Krivosheina & Mamayev, 1962) was included in the Finnish species list in Fauna Europaea (Speight 2004). Authors have not found any specimens or publications that reliably show *T. meridionale* to belong in the Finnish fauna.

Notes

Melanostoma mellinum (Linnaeus, 1758) and *Melanostoma dubium* (Zetterstedt, 1837) form a species complex and it is very doubtful whether present species concepts provide an accurate reflection of the number of *Melanostoma* species (Speight 2013).

Platycheirus modestus Ide, 1926. A previously unpublished record. A new species to the Palaearctic. One male was collected in 4.7.2008 from Obb: Tornio (leg. I. Kakko).

Dasysyrphus spp. Both *D. venustus* (Meigen, 1822) and *D. hilaris* (Zetterstedt, 1843) are known to contain several species (Haarto and Kerppola 2007a, Bartsch 2009a).

Cheilosia barovskii (Stackelberg, 1930). A previously unpublished record. Five females were collected in 30.5.1937 from Ta: Sääksmäki (leg. K.E. Kivirikko) and one female in 20.5.2013 from N: Sipoo (leg. T. Järveläinen).

Myolepta nigra (Loew, 1872) was erroneously included in the list of Finnish flies (Hackman 1980) instead of *Helleniola nigra* (Zetterstedt, 1843) = *Chrysosyrphus niger* (Hackman 1982).

The used nomenclature of the species *E. nemorum* (Linnaeus, 1758), *E. arbustum* (Linnaeus, 1758) and *E. horticola* (De Geer, 1776) follows the proposal in Case 3259 by Chandler et al. (2004) and the usage of these names is confirmed in Opinion 2153 by ICZN (International Commission on Zoological Nomenclature) (2006).

Mallota tricolor Loew, 1871. A previously unpublished record. One male was collected in 4.8.1977 from Ta: Hämeenlinna (leg. M. Raekunnas) and another male in 13.6.–6.7.2013 from Sa: Joutseno (leg. J. Vilén).

Microdon mutabilis (Linnaeus, 1758) and *Microdon myrmicae* Schönrogge, Barr, Wardlaw, Napper, Gardner, Breen, Elmes & Thomas, 2002 form a species complex the species of which can be separate only by characters of the larvae and the puparia (Bartsch 2009b). In the Finnish checklist *M. mutabilis* represents either of the two species or include both of the species.

Abstract

A checklist of the Diptera superfamilies Conopoidea (Conopidae), Nerioidae (Micropezidae, Pseudopomyzidae) and Diopsoidea (Megamerinidae, Psilidae, Strongylophthalmyiidae, Tanypezidae) from Finland is presented. *Myopa vicaria* Walker, 1849 is formally recorded for the first time from the country.

Keywords

Checklist, Finland, Diptera, biodiversity, faunistics

Introduction

Four fly families form the superfamily Nerioidae. Two of them, Micropezidae and Pseudopomyzidae, occur in Finland. Neriids are mostly tropical and cypselomatids (*sensu stricto*) have only been found in the Australasian and Oriental regions. The pseudopomyzids were included in Cypselosomatidae Hendel, 1931 in the previous checklist (Hackman 1980) and are still often included in Cypselosomatidae *sensu lato*. The

Table 1. Number of species by family.

Family	Number of species in			Level of knowledge
	World (Pape et al. 2011)	Europe	Finland	
Conopidae	~796	83	19	good
Nerioidea:				
Micropezidae	573	22	6	average
Pseudopomyzidae	18	1	1	good
Diopsoidea:				
Psilidae	320	47	29	average
Tanypezidae	27 (Lonsdale 2013)	1	1	good
Strongylophthalmyiidae	47 (Lonsdale 2013)	2	2	good
Megamerinidae	15	1	1	good

Finnish micropezid fauna is relatively well known. One or two species of *Cnodacophora* Czerny, 1930 and *Rainieria* Rondani, 1843 could be present but are so far undetected.

Diopsoidea consists of seven to ten families (depending on the source), none particularly species-rich. Only four are found in Finland: Psilidae, Tanypezidae, Strongylophthalmyiidae and Megamerinidae. Tanypezidae and Strongylophthalmyiidae are here treated as separate families following Lonsdale (2013). Megamerinidae has been assigned to several superfamilies, most often Diopsoidea following McAlpine (1989), but also Nerioidea, Sciomyzoidea, and recently Opomyzoidea (Wiegmann et al. 2011). These families have raised no particular interest among Finnish dipterists. The genus *Chamaepsila* Hendel, 1917 in particular needs more attention. It is likely that a few Finnish species remain unrecognised in this genus.

The systematic position of the Conopidae is unclear. It has traditionally been considered basal within Schizophora. Wiegmann et al. (2011) listed Conopidae within Sciomyzoidea while others (see Skevington et al. 2010) place the family near Tephritoidea. Within the family the recent classification of Gibson and Skevington (2013) is followed. The Finnish conopid fauna is now relatively well-understood and few additional species are expected to occur in the country.

The Finnish species of these families were last listed by Hackman (1980).

TANYPEZIDAE Rondani, 1856

TANYPEZA Fallén, 1820

Tanypeza longimana Fallén, 1820

Excluded species

Dalmannia punctata (Fabricius, 1794) not found within present borders.

Notes

Chamaepsila unilineata (Zetterstedt, 1847) and *C. nigrosetosa* Frey, 1925 were synonymized with *C. pallida* but they have recently been reinstated as valid species (Shatalkin and Merz 2010).

Loxocera ichneumonea (Linnaeus, 1758). This name has been used for *L. aristata* (Panzer) and *L. albisetata* (Schrank). Unfortunately no type material is known. Linné's original description is insufficient and may in fact belong to a hoverfly (see Buck and Marshall 2006).

Myopa vicaria Walker, 1849. One of the common *Myopa* species through Finland, but previously unreported due to difficulties in identification. Recorded from provinces *Ab*, *N*, *Ka*, *St*, *Ta*, *Sa*, *Kl*, *Om*, *Ok*, *Lkoc* and *Li*.

Abstract

A revised checklist of the flies of superfamilies Tephritoidea and Sciomyzoidea of Finland is provided. The following families are covered: Eurygnathomyiidae, Lonchaeidae, Neottiophilidae, Pallopteridae, Piophilidae, Platystomatidae, Tephritidae, Ulidiidae (Tephritoidea); Coelopidae, Dryomyzidae, Heterocheilidae, Phaeomyiidae, Sciomyzidae, Sepsidae (Sciomyzoidea).

Keywords

Finland, Diptera, checklist, Tephritoidea, Sciomyzoidea

Introduction

With over 7800 known extant species (Pape et al. 2011), Tephritoidea is one of the larger Diptera superfamilies. The nominotypical family of Tephritoidea, the fruit flies (Tephritidae), includes over half of the currently known species in the superfamily. The highest diversity of tephritoids occurs in the tropics. Six of the nine extant tephritoid families have been found in Finland: no richardiid, ctenostylid or pyrgotid have been found in the country. The Tephritidae, Ulidiidae and Platystomatidae (plus Pyrgotidae) form a well-defined, probably monophyletic group. The other tephritoid families are more basal in their phylogenetic position (Korneyev 1999). The exact relationships

Table 1. Number of species in tephritoid and sciomyzoid families.

Family	Number of species in			Level of knowledge
	World (Pape et al. 2011)	Europe (Pape and Beuk 2013)	Finland	
Tephritoidea:				
Eurygnathomyiidae	1	1	1	good
Lonchaeidae	504	96	41–44	average
Neottiophilidae	4	2	2	average
Pallopteridae	70	22	13	good
Piophilidae	78	27	15	average
Platystomatidae	1162	21	2	good
Tephritidae	4712	267	69	average–good
Ulidiidae	675	106	16	good
Sciomyzoidea:				
Coelopidae	35	3	1	average
Dryomyzidae	22	5	5	average
Heterocheilidae	2	1	1	average
Phaeomyiidae	3	3	2	good
Sciomyzidae	605	136	73–74	good
Sepsidae	340	48	32	good

between the families are far from settled and some authors exclude Pallopteridae and Eurygnathomyiidae from the superfamily (Wiegmann et al. 2011). Several subfamily schemes have been proposed for Tephritidae. The classification by Korneyev (2000) is adopted here. For Pallopteridae, Piophilidae (with Neottiophilidae) and Ulidiidae we follow McAlpine (1981), Ozerov (2005) and Kameneva and Korneyev (2006) respectively. Norrbom et al. (1999) provide a catalogue of world tephritid names. The Finnish tephritoid flies were last listed by Winqvist and Kahanpää (2007). Hackman (1956) reviewed the Lonchaeidae of Eastern Fennoscandia. This paper is now somewhat outdated, but still valuable.

Sciomyzoidea is a smaller superfamily with some 1150 described species (Pape et al. 2011). It includes two medium-sized families (Sciomyzidae and Sepsidae) and nine smaller families comprising at most 30 species. The millipede parasitoids of family Phaeomyiidae are sometimes classified as a subfamily of Sciomyzidae. The coelopids and heterocheilids, with just one species each in Finland, are closely associated with stranded marine seaweed. The family placement of *Heterocheila* has been rather unstable: during the last 40 years it has been placed in Helcomyzidae, Dryomyzidae and Coelopidae or regarded as having a separate family status. Here we follow the recent world catalogue (Mathis 2011) and keep Heterocheilidae as a separate family. The family name Heterocheilidae is preoccupied by Heterocheilidae Railliet & Henry, 1915 in Nematoda (Mathis 2011). This homonymy has not yet been resolved.

World catalogues have recently been published for Coelopidae (Mathis and McAlpine 2011) Dryomyzidae (Mathis and Sueyoshi 2011), Heterocheilidae (Mathis 2011), Sciomyzidae (Rozkošný 1995) and Sepsidae (Ozerov 2005). The Finnish sciomyzoid flies were last listed by Winqvist and Kahanpää (2007).

Notes

***Allopiophila dudai* (Frey, 1930).** This species was described by Frey (1930) from the Kola peninsula (Murmansk Oblast, Russia). Frey et al. (1941) and Hackman (1980) listed it from Finland, but to our knowledge it has never been reliably recorded from this country.

***Allopiophila* sp. A.** An apparently undescribed arctic species near *A. vulgaris*.

***Campiglossa* sp. A** is a distinct, possibly undescribed species of *Campiglossa*. It is common on *Saussurea alpina* in Northern Finland (Juhani Itämies, priv. comm.).

***Lonchaea bruggeri* Morge, 1967, *L. contigua* Collin, 1953 and *L. difficilis* Hackman, 1956.** No males have been confirmed from the country. See Winqvist and Kahanpää (2007) for more details.

***Lonchaea bukowskii* Czerny, 1934.** No males have been confirmed from the country.

***Tephritis* sp. cf. *rydeni* Hering, 1956.** Finnish material formerly assigned to *T. dioscurea* (Loew, 1856) belongs to a currently unrecognised species that may be *T. rydeni* Hering (Söderman et al. 2007, Winqvist and Kahanpää 2007).

***Tetanocera amurensis* Hendel, 1909.** Recorded from Finland in Fauna Europaea (Rozkošný and Knutson 2011) and known from Estonia and Northwestern European Russia (Elberg 1988). We have been unable to find any Finnish material or primary published records.

Abstract

A revised checklist of the Chamaemyiidae and Lauxaniidae (Diptera) recorded from Finland is presented.

Keywords

Checklist, Finland, Diptera, biodiversity, faunistics

Introduction

Three families are currently recognized in Lauxanoidea, two of which are present in Finland. The exception is the beetle flies (Celyphidae), which are restricted to the Oriental and Afrotropical Regions.

The silvery white flies of the family Chamaemyiidae are poorly studied in Finland. Reliable identification of most species is, at least for now, only possible by the examination of male genitalia. Unfortunately many species have not been adequately (re)described which has resulted in much confusion about the proper use of species names. It is likely that several additional chamaemyiid species will be found in Finland. Of the

two subfamilies of chamaemyiids, Cremifaniinae is absent from Finland. Chamaemyiinae is split into two tribes, Chamaemyiini and Leucopini, although the monophyly of the former has not yet been demonstrated (Gaimari 2010).

The lauxaniids are better known both in Finland and worldwide. Additional species are still likely to be found in the country, especially among *Homoneura* and *Sapromyza*. Of the three subfamilies, the Eurychoromyiinae, a strictly Neotropical group (Gaimari and Silva 2010a), is absent from the Palaearctic. The other two subfamilies, Homoneuriinae and Lauxaniinae, are both present in Finland. The subfamily Lauxaniinae is probably paraphyletic as currently defined (Gaimari and Silva 2010b).

The Finnish species of these families were last listed by Hackman (1980). Kahanpää (2013) reviewed the changes in the Finnish lauxaniid fauna since 1980.

Number of species (Chamaemyiidae, Lauxaniidae):

World: 336 (S. Gaimari, pers. comm. March 18, 2014), 1895 species (Pape et al. 2011)

Europe: 107, 157 species (Fauna Europaea)

Finland: 27–28, 45 species

Faunistic knowledge level in Finland: poor, average

Sapromyza leningradensis Czerny, 1932 nomen dubium ?

Notes

Several chamaemyiid species mentioned in this checklist have not been previously recorded from Finland. A paper detailing the new records is in preparation.

***Chamaemyia herbarum* (Robineau-Desvoidy, 1830).** A poorly known species. The name has been widely used for various *Chamaemyia* species in the past. Coe (1943) and Collin (1966) applied this name (without seeing types) to a species which may be *C. subjuncorum* Tanasijtshuk, 1980 (*sensu* Beschovski, 1995). Czerny (1936) and Tanasijtshuk (1986) listed this species as a junior synonym of *Chamaemyia juncorum* (Fallén). Most Finnish specimens under this name are either unidentifiable females or belong to other species, most frequently *C. aestiva* Tanasijtshuk, 1970, but some specimens probably belonging to *C. herbarum* R.-D. *sensu* Coe have been found in Finland.

***Minettia(?) styriaca* (Strobl, 1892).** This species, originally described in *Sapromyza*, has traditionally been placed in *Minettia*. Unfortunately Strobl's description, which was based on a single female, is rather short and unillustrated. The holotype is lost according to Chvála (2008). The Finnish and Russian material in the Finnish Museum of Natural History (MZH) identified as *Minettia styriaca* (see Kahanpää 2013 for data and a photograph) matches Strobl's description, but these specimens lack the postsutural supra-alar setae found in *Minettia* (and many other genera).

Acknowledgements

I would like to thank Dr. Stephen Gaimari for his valuable comments and suggestions on improving this paper.

Abstract

A species checklist is presented for Finland covering seven smaller families of Opomyzoidea: Anthomyzidae, Asteiidae, Aulacigastridae, Clusiidae, Odiniidae, Opomyzidae and Periscelididae (Diptera).

Keywords

Checklist, Finland, Diptera, biodiversity, faunistics

Introduction

The superfamily Opomyzoidea is likely to be para- or polyphyletic (see Wiegmann et al. 2011). It has long been used as a dumping grounds for acalyprate taxa that do not fit well elsewhere. As such, the superfamily is poorly defined and hardly any two authors agree on its definition. Opomyzoidea includes one large family (Agromyzidae, the leaf-mining flies, with over 3000 described species) and more than a dozen small families. The exact number of recognized families varies. The Agromyzidae are treated

Table 1. Number of species by family.

Family	Number of species in			Level of knowledge
	World (Pape et al. 2011)	Europe	Finland	
Anthomyzidae	93	28	15	average
Asteiidae	136	18	6	average
Aulacigastridae	18	4	2	good
Clusiidae	360	14	12	good
Odiniidae	64	14	5	average
Opomyzidae	59	33	16	average
Periscelididae	83	6	4	average

elsewhere in this volume of ZooKeys. The remaining opomyzoid families are presented here in alphabetical order.

Hackman (1980) last listed the Finnish species of these families. World catalogues have recently been published for Periscelididae (Mathis and Rung 2011) and Odiniidae (Gaimari and Mathis 2011). For Anthomyzidae the Revision of West Palearctic Anthomyzidae by Roháček (2006, 2009) is followed. Three of the four Palearctic *Aulacigaster* species have been found in Europe (Kassebeer 2001, Rung and Mathis 2011). Papp and Withers (2011) reviewed the Palearctic Periscelidinae and proposed some nomenclatorial changes. Hackman's (1959) review of the Finnish opomyzid fauna is still valuable but several additional species have since been recognized.

Odinia mijerei Collin, 1952 misidentified

Notes

Aulacigaster pappi Kassebeer, 2001. Most of the Finnish *Aulacigaster* material belong to this species, including all specimens currently stored in the Finnish Museum on Natural History (MZU). Storå (1956, 1957) and Hackman (1980) misidentified *A. pappi* as *A. leucopeza*. A few Finnish specimens of the real *A. leucopeza* were found in private collections.

Clusiodes gentilis (Collin, 1912). Lonsdale and Marshall (2007) record this species from Finland on a map. The data is apparently taken from Frey (1928). As Tuomikoski (1936) has pointed out, Frey misidentified *C. caledonicus* as *C. gentilis*.

Citation: Kahanpää J (2014) Checklist of the leaf-mining flies (Diptera, Agromyzidae) of Finland. In: Kahanpää J, Salmela J (Eds) Checklist of the Diptera of Finland. ZooKeys 441: 291–303. doi: 10.3897/zookeys.441.7586

Abstract

A checklist of the Agromyzidae (Diptera) recorded from Finland is presented. 279 (or 280) species are currently known from the country. *Phytomyza linguae* Lundqvist, 1947 is recorded as new to Finland.

Keywords

Checklist, Finland, Diptera, biodiversity, faunistics

Introduction

The Agromyzidae are called the leaf-miner or leaf-mining flies and not without reason, although a substantial fraction of the species feed as larvae on other parts of living plants. While Agromyzidae is traditionally placed in the superfamily Opomyzoidea, its exact relationships with other acalyprate Diptera are poorly understood (see for example Winkler et al. 2010).

Two subfamilies are recognised within the leaf-mining flies: Agromyzinae and Phytomyzinae. Both are now recognised as natural groups (Dempewolf 2005, Scheffer et al. 2007). Unfortunately the genera are not as well defined: at least *Ophiomyia*, *Phytoliriomyza* and *Aulagromyza* are paraphyletic in DNA sequence analyses (see Scheffer et al. 2007). The same studies and Winkler et al. (2009) suggest that *Chromatomyia*

consists of at least two separate groups of species within *Phytomyza*, and *Napomyza* (which is given a status of a subgenus of *Phytomyza* by Winkler et al. (2009)) also needs re-evaluation. For the purposes of this checklist, a conservative approach is adopted with *Chromatomyia* and *Napomyza* as separate genera.

Richard Frey was the first Finnish dipterist to study the agromyzid fauna of the country in detail (Frey 1937, 1946). L. Tiensuu and E. Thuneberg continued Frey's work but most of their work remained unpublished until Nowakowski (1967) and Spencer (1976) reviewed the major Finnish agromyzid collections. Spencer's book remains the primary identification tool for North European Agromyzidae. Interest in Finnish agromyzids has remained sporadic. The Finnish species were last listed by Hackman (1980).

Number of species:

World: 3004 spp. (M. Černý & M. von Tschirnhaus, pers. comm., March 2014)

Europe: 914 species (von Tschirnhaus, pers. comm., March 2014)

Finland: 279–280 species

Faunistic knowledge level in Finland: average

Phytomyza atricornis Meigen, 1838 nomen dubium
Phytomyza brischkei Hendel, 1922 misidentification

Notes

Agromyza nigrociliata. First recorded from Finland by Thuneberg in Kaisila (1960). The species have since been found at several sites on the south coast (leg. L. Tien-suu, K. Winqvist & J. Kahanpää).

Cerodontha pygmella. First described from the Russian Far East, then redescribed from northern Sweden as *C. lapplandica* (Rydén) (synonymized by Zlobin 2001) and from Poland as *C. tatica* Nowakowski (syn. Spencer 1976). The status of this species as distinct from *C. pygmaea* has been doubtful, but Zlobin (2001) pointed out that while *C. pygmella* and *C. pygmaea* are difficult to identify reliably as adults, the larvae are clearly different.

Liriomyza pedestris Hendel, 1931 is a valid species according to Zlobin (2003). The Finnish material of the *L. flaveola*-group needs re-examination.

Ophiomyia fennoniensis Spencer is probably a synonym of *O. eucodonius* Hering. Likewise, ***Ophiomyia vitiosa*** Spencer is probably a synonym of *O. alliariae* Hering, 1954 (M. von Tschirnhaus, pers. comm.)

Phytomyza angelicae and ***P. aegopodii***. Spencer (1976) synonymized *P. aegopodii* Hendel, 1923 with *P. angelicae* Kaltenbach. Pakalniškis (2000) reinstated *P. aegopodii* as a valid species but opinions on its status are not unanimous. The Finnish material examined so far represents typical *P. angelicae* sensu Pakalniškis (2000).

Phytomyza brischkei. Recorded by Hackman (1980) from Finland, probably on the basis of Frey (1937). As Spencer (1976) points out, this is a misidentification.

Phytomyza gymnostoma. Recorded from Finland in Fauna Europaea (Martinez 2011), but I have been unable to trace the original records. Possibly imported to Finland with leeks or onions (*Allium*), its host plants. *P. gymnostoma* is an expanding species with Central Europe and has lately damaged crops of *Allium* species (Darvas et al. 1988).

Phytomyza linguae. Spencer (1976) synonymised this species with *P. ranunculivora* Hering. Pakalniškis (1997) reinstated it as a valid species. Both species occur in Finland: L. Tiensuu reared *P. ranunculivora* from *Ranunculus acer* and *P. linguiae* from *Ranunculus lingua* from mines collected from Vehkalahti in 1972–3.

Acknowledgements

I would like to heartily thank Michael von Tschirnhaus for all the help he has given Finnish dipterists interested in Agromyzidae over the last decade and especially for his numerous valuable comments on an early version of this paper.

Citation: Kahanpää J (2014) Checklist of the Diptera families Acartophthalmidae, Canacidae (including Tethinidae), Carnidae and Milichiidae of Finland (Insecta). In: Kahanpää J, Salmela J (Eds) Checklist of the Diptera of Finland. ZooKeys 441: 305–309. doi: 10.3897/zookeys.441.7144

Abstract

A checklist of 29 species in the smaller carnid families Acartophthalmidae, Canacidae, Carnidae and Milichiidae (Diptera) recorded from Finland is presented. Tethinidae are also included as a subfamily of Canacidae. *Phylomyza tetragona* Hendel is removed from the list as no reliable records of this species within the post-1944 borders of Finland could be found.

Keywords

Checklist, Finland, Diptera, biodiversity, faunistics

Introduction

The superfamily Carnoidea (*sensu* Buck 2006 but excluding Cryptochetidae, see Wiegmann et al. 2011) includes seven families. The largest by far is Chloropidae, treated in a separate article in this issue. Four of the remaining six are found in Finland: Acar-

Table 1. Number of species by family.

Family	Number of species in			Level of knowledge
	World (Pape et al. 2011)	Europe	Finland	
Acartophthalmidae	5	3	3	average
Canacidae	322	38	1	average
Carnidae	93 (Brake 2011)	39	13	poor
Milichiidae	278	43	12–13	average

tophthalmidae, Canacidae, Carnidae and Milichiidae. The remaining two families, Inbiomyiidae and Australimyzidae, are respectively restricted to the Neotropical and Australasian Regions.

All four families are rather poorly studied in Finland. The presence of additional, even undescribed, species is very likely in Carnidae and Milichiidae. The identification of all species of *Meoneura* was verified from male genitalia during the preparation of this checklist with one exception: the male of *Meoneura elongella* (Zetterstedt, 1838) remains undescribed. It is the only North European *Meoneura* with black halteres and as such easily recognised.

World catalogues have recently been published for Canacidae (Munari and Mathis 2010), Carnidae (Brake 2011), and Milichiidae (Brake 2000). The Finnish species of these families were last listed in Hackman (1980).

Checklist

suborder Brachycera Macquart, 1834

clade Eremoneura Lameere, 1906

clade Cyclorrhapha Brauer, 1863

Phyllomyza formicae Schmitz, 1923

Phyllomyza longipalpis (Schmitz, 1924)

Phyllomyza rubricornis Schmitz, 1923

Phyllomyza securicornis Fallén, 1823

Phyllomyza silesiaca (Duda, 1935)

Excluded species

Phyllomyza tetragona Hendel, 1924 not found within present borders

Tethina grisea (Fallén, 1823) misidentification?

Tethina illota (Haliday, 1838)

Notes

Meoneura. At least two additional, possibly undescribed species occur in Finland.

***Phyllomyza equitans* (Hendel, 1919).** Only females have been found in Finland.

***Tethina grisea* (Fallén, 1823) and *T. illota* (Haliday, 1838).** Munari and Mathis (2010) list two *Tethina* species from Finland. Krogerus (1932) is mentioned as the source for the *T. grisea* record; there is no listed source for the record of *T. illota*. An older version of the world catalogue (Mathis and Munari 1996) mentions only *T. grisea* from Finland. No Finnish specimens of these species could be found in the Finnish Museum of Natural History (MZB) where most of the material collected by Krogerus is kept, or in any other Finnish insect collection. Unfortunately the identifications in Krogerus (1932) are rather unreliable. It is possible that *Tethina* species occur in Finland, but none are included in this checklist because the evidence for their presence is, in my opinion, insufficient.

Abstract

A checklist of 147 species the Chloropidae (Diptera) recorded from Finland. *Centorisoma elegantulum* Becker is recorded for the first time from Finland.

Keywords

Finland, Chloropidae, species list, biodiversity, faunistics

Introduction

The Chloropidae is a large family of acalyprate Diptera. It belongs to superfamily Carnoidea with Milichiidae as the closest relative. The classification of the family used follows Andersson (1977) and Nartshuk (1983).

The North European chloropid fauna has recently been revised by Nartshuk and Andersson (2013). Details of Finnish chloropid literature, species distribution and ecology, and other details can be found in their book. In comparison with the neighbouring countries, Finland ranks second in the number of chloropid species after Sweden (189 species) but well ahead of Denmark (119 species) and Norway (97 species). The genera *Gaurax*, *Incertella* and *Rhopalopterum* need more attention as there are several species in these genera known from neighbouring countries but not from Finland.

This checklist is based mostly on museum material in the Finnish Natural History museum (MZB) studied by E. Nartshuk. The Finnish species were last listed in Nartshuk and Andersson (2013).

Number of species:

World: 2880 species (Pape et al. 2011)

Europe: 394 species

Finland: 149–150 species

Faunistic knowledge level in Finland: average

Abstract

A Finnish checklist of the sphaeroceroid fly families Chyromyidae and Heleomyzidae is provided.

Keywords

Species list, Finland, Diptera, biodiversity, faunistics

Introduction

The superfamily Sphaeroceroidea is a medium-sized one, with two families of moderate diversity, Sphaeroceridae (1550 species) and Heleomyzidae (~720 species), and the small family Chyromyidae. The enigmatic afrotropical *Mormotomyia hirsuta* Austen, 1936 was once placed near Sphaeroceridae but it is now seen as an ephydroid fly (Kirk-Spriggs et al. 2011). McAlpine (2007) has proposed an alternative concept for Sphaeroceroidea with Sphaeroceridae and Heleomyzidae united as a single family called Heteromyzidae. This proposal has not gained significant support and for the purposes of this checklist the traditional concept of family Sphaeroceridae is retained.

Table 1. Number of species by family.

Family	Number of species in			Level of knowledge
	World (Pape et al. 2011)	Europe	Finland	
Chyromyidae	138	59	4	poor-average
Heleomyzidae	727	175	61	average

There is no general agreement on the relationships of various heleomyzid tribes. Several different schemes for subfamilies have been proposed (see McAlpine 2007, McAlpine and Woodley 2010). Some taxa treated here as heleomyzids (primarily Trixoscelidinae, Chiropteromyzinae, Heteromyzinae and Borboropsini) may deserve full family status. As a conservative approach this checklist follows Marshall (2012) and keeps them as subfamilies and tribes. The heleomyzid subfamilies and tribes are listed alphabetically.

The Finnish chyromyids are small yellow flies with (at least while alive) iridescent blue or green eyes. Chyromyids are rarely collected and little is known about their ecology or the proper place of the family within Sphaeroceroidea. They may actually be a specialized lineage arising from within Heleomyzidae *sensu lato*.

Two of the three sphaeroceroid families are treated in this paper. The largest, Sphaeroceridae, is covered in a separate paper in this issue of ZooKeys. The Finnish species of Heleomyzidae and Chyromyidae were last listed by Hackman (1980).

Trixoscelis similis Hackman, 1970

Notes

***Chyromya oppidana* (Scopoli, 1763).** Found only inside houses and farm buildings in Finland.

***Orbellia nivicola* Frey, 1913.** This species was synonymized with *O. myiopiformis* R.-D. by Storå (1958), but Frey (1958) defended its validity. The status of *O. nivicola* as a species needs verification.

***Trixoscelis canescens* (Loew, 1865).** This species was originally described on the basis of a single female. Soós (1979) examined the type and revived the name from synonymy with *T. frontalis*. Woźnica (2008) provided an illustrated diagnosis for *T. canescens* and synonymized *T. gigans* Carles-Tolrá, 2001 and *T. fumipennis* Papp, 2005 with it. The species was recently recorded from Finland by Flinck and Kahanpää (2013). Specimens with darkened costal veins and dorsal abdominal surfaces, both proposed diagnostic characters of *T. canescens*, are common among Finnish *T. frontalis* material (see Fig. 8 in Flinck and Kahanpää 2013). Finnish males with these features have genitalia identical with those illustrated for *T. frontalis* by Hackman (1970) and quite unlike the genitalia of *T. gigans* (= *fumipennis* Papp). The male specimen mentioned in Flinck and Kahanpää (2013) was later dissected and it belongs to *T. frontalis*. The external characters (darkened costa and dorsum of abdomen) can not be used to reliably separate *T. canescens* from *T. frontalis*. The Finnish records of *T. canescens* are probably all misidentifications of *T. frontalis*.

Abstract

A checklist of the family Sphaeroceridae (Diptera) recorded from Finland.

Keywords

Checklist, Finland, Diptera, Sphaeroceridae

Introduction

Sphaeroceridae or lesser dung flies are mostly small and dull dark brown to grey acalypratae flies. They are easily distinguished from other acalypratae because of the short and thickened basal tarsomeres of hind legs. Larvae of Sphaeroceridae develop in decaying organic matter such as decaying vegetation, dung and rotten fungi.

The family has gathered little interest among entomologists in Finland. Walter Hackman concentrated on the taxonomy of the subfamily Copromyzinae (Hackman 1965) and investigated the dipterous fauna, including sphaerocerids, in the burrows of small mammals (Hackman 1963). Hackman (1980) published the latest list of the Finnish sphaerocerid species. Further species were added in several revisions of Eu-

ropean taxa by Roháček (1982, 1983, 1991). There has been increasing interest in sphaerocerids in Finland after the year 2000 (see Haarto and Kahanpää 2013).

The classification follows the world catalogue of Sphaeroceridae (Roháček et al. 2001, Marshall et al. 2011).

Number of species:

World: 1571 species (Pape et al. 2011)

Europe: 257 species

Finland: 118 species

Faunistic knowledge level in Finland: average

Abstract

A checklist of the Braulidae (1 species), Camillidae (3 spp.), Diastatidae (10 spp.) and Drosophilidae (67 spp.) of Finland is presented. Campichoetinae is included as a subfamily of Diastatidae.

Keywords

Checklist, Finland, Diptera, biodiversity, faunistics

Introduction

The Ephydrioidea is now recognized as a well-supported, probably monophyletic clade of acalyprate flies (Wiegmann et al. 2011), although the correct placement of some of the included families – especially the very unusual bee louses of family Braulidae – is still being discussed. The relationships of the families within the superfamily are less understood and the families are listed alphabetically in the checklist below. Seven or eight families are currently included in Ephydrioidea. Five of them are found in Finland. Four families are covered in this paper; the fifth (Ephydriidae itself) has its own treatment in this volume of ZooKeys. The families missing from Finland are the Curtonotidae, Cryptochetidae, and Nannodastiidae with uncertain affinities (Papp

Table 1. Number of species by family.

Family	Number of species in			Level of knowledge
	World (Pape et al. 2011)	Europe	Finland	
Braulidae	7	3	1	poor
Camillidae	40	8	3	average
Diastatidae	49 (Mathis and Barraclough 2011)	16	10	good
Drosophilidae	4003	121	67	good

and Mathis 2001). Griffiths (1972) proposed a new family, Campichoetidae, for *Campichoeta* Macquart, 1835. We follow the world catalogue of Diastatidae (Mathis and Barraclough 2011) and keep Campichoetinae as a subfamily of Diastatidae.

World catalogues have been recently published for Diastatidae (Mathis and Barraclough 2011) and Drosophilidae (Brake and Bächli 2008). The North European Drosophilidae were treated in detail by Bächli et al. (2004) and the review of Finnish *Drosophila* by Hackman (1954) is now obsolete. The Finnish species of Braulidae and Camillidae were last listed by Hackman (1980); the diastatids were treated by Chandler (1987).

Abstract

A checklist of 112 species of shore flies (Ephydriidae, Diptera) recorded from Finland is presented. Comparing this to the list of Hackman (1980), 52 changes are made: 25 species are added (all but one recorded after 1980), 18 misidentifications are deleted, 5 junior synonyms are replaced and 5 updated generic combinations are given.

Keywords

Checklist, Finland, Diptera, Ephydriidae

Introduction

Shore flies (Ephydriidae) are dark coloured, dull to shining, 1–6 mm long flies. Most species develop in aquatic or semi-aquatic conditions, feeding of algae, bacteria, yeasts or even decaying animal matter and excrements; or they are phytophagous and mining in leaves or stems. The group is divided into 5 subfamilies and 19 tribes (Zatwarnicki 1992), of which 15 could potentially be found in Finland.

Hackman (1980) originally listed 105 species. Zatwarnicki (1997) corrected the synonymy and generic placement of some species. Compared to Hackman (1980)

the present list adds 25 species and removes 18 misidentified species (mostly *Hydrellia*). Five junior synonyms in *Hydrellia*, *Philygria*, *Scatella* and *Scatophila* are replaced; four species of *Ditrichophora* are combined with *Gymnoclasiopa* and one species of *Lamproscatella* with *Haloscatella*. Two species are endemic for Finland: *Psilopa nitidifacies* Frey, 1930 (note that this was omitted by Hackman 1980), and *Gymnoclasiopa psilopina* (Frey, 1933).

Nomenclature follows the current version of the Ephydriidae section of Fauna Europaea (Zatwarnicki 2013). The subfamilies and the tribes are ordered systematically; genera within tribes and species within genera are listed alphabetically.

Number of species:

World: 1927 species and 63 nomina dubia (as of February 2014)

Europe: 340 species and 3 subspecies (Zatwarnicki 2013)

Finland: 112 species

Faunistic knowledge level in Finland: average

Excluded species

- Gymnoclasiopa aurifacies* (Strobl, 1893) misidentified
Gymnoclasiopa plumosa (Fallén, 1923) misidentified
Hyadina nigricornis Frey, 1930 not found within present borders
Hydrellia argyrogenis Becker, 1896 misidentified
Hydrellia concolor (Stenhammar, 1844) misidentified
Hydrellia flavidicornis (Fallén, 1823) misidentified
Hydrellia incana (Stenhammar, 1844) misidentified
Hydrellia meigeni Zatwarnicki, 1988 misidentified
 = *albiceps* (Meigen, 1830) preocc.
Hydrellia nymphaea (Stenhammar, 1844) misidentified
Hydrellia tibialis Cresson, 1917 not found within present borders
 = *diadema* Frey, 1930
Notiphila stagnicola (Robineau-Desvoidy, 1830) misidentified
Psilopa pulicaria (Haliday, 1839) misidentified
Scatella lutosa Haliday, 1833 misidentified

Notes

Gymnoclasiopa aurivillii (Becker, 1896) is probably a junior synonym of *Gymnoclasiopa nigerrima* (Strobl, 1893).

Hydrellia. At least two additional species occur in Finland but their proper names are still under investigation.

Abstract

A revised checklist of the Scathophagidae, Fanniidae and Muscidae recorded from Finland is presented. *Phaonia amicula* Villeneuve, 1922 is noted from Finland for the first time.

Keywords

Species list, Finland, Diptera, biodiversity, faunistics

Introduction

Four families make up the traditional superfamily Muscoidea: Scathophagidae, Anthomyiidae, Fanniidae and Muscidae. The monophyly of the superfamily has been strongly questioned (Nirmala et al. 2001, Kutty et al. 2010) on the basis of DNA sequence analyses.

Three of the four families of Muscoidea are treated in this paper, the fourth (Anthomyiidae) is covered in a separate paper in this issue of ZooKeys. All three are important components of the Finnish fly fauna as can be seen from the large number of species involved and the fact that the species recorded from the country represent up to one fifth of the world fauna in the case of Scathophagidae.

Table 1. Number of species by family.

Family	Number of species in			Level of knowledge
	World (Pape et al. 2011)	Europe	Finland	
Scathophagidae	419	158	85–86	good
Fanniidae	359	83	61	average
Muscidae	5218	572	307–309	average

Unfortunately the muscoid flies have been poorly collected and studied in Finland in comparison with many other Diptera families. Lauri Tiensuu concentrated on these families during the 1930s (1935, 1938, 1939) and Walter Hackman (1956) reviewed the Finnish Scathophagidae. During the last ten years, both the fanniids (Kahanpää and Haarto 2013) and the muscids (Kahanpää 2013) have attracted some attention in the country. The number of species known from the country has increased markedly since the year 2000.

The Finnish muscoid species were last listed by Hackman (1980).

Excluded species

- Coenosia femoralis* (Robineau-Desvoidy, 1830) misidentified
Fannia barbata (Stein, 1892) not found within present borders
Fannia lineata (Stein, 1895) not found within present borders
Fannia nigra Malloch, 1910 not found within present borders
Hydrotaea glabricula (Fallén, 1825)
Limnophora pollinifrons Stein, 1916 not found within present borders
Phaonia bitincta (Rondani, 1866) misidentified
Scathophaga calida Haliday in Curtis, 1832 not found within present borders
Spilogona acrostichalis (Stein, 1916)
Spilogona norvegica (Ringdahl, 1932)
Spilogona obscuripennis (Stein, 1916) not found within present borders
Spilogona septemnotata (Zetterstedt, 1845) misidentified
Spilogona setigera (Stein, 1907)
Spilogona spininervis (Villeneuve, 1922)

Notes

***Coenosia comita* (Huckett, 1936).** Collected only from Salla. The type locality of *C. ovulivera* Tiensuu, Vuorijärvi, is now Russian territory (Tiensuu 1938). A second specimen, also taken in 1936 by R. Krogerus (in MZH), bears only the label 'Salla' and probably also originates from the vicinity of Vuorijärvi, but it is possible that it was collected from the Finnish part of Salla, a municipality split between Russia and Finland in 1944.

***Helina ciliata* Karl, 1929.** Ringdahl (1952), quoting "Tiensuu's papers", lists this species from Finland. We could not locate the original record in Tiensuu's published works or among the available collection specimens. It seems possible Ringdahl made a mistake in his tables. The species is also listed as Finnish by Hackman (1980), again without any details.

***Limnophora pandellei* Séguy, 1923.** Only females have been found in Finland. The identification remains slightly doubtful (Kahanpää 2013).

***Norellia tipularia* (Fabricius, 1794).** This species was first recorded from Finland by Winqvist (2011). Šifner (2003, 2008) considers *N. tipularia* a nomen dubium and probably synonymous with *N. spinipes* Meigen, but Ozerov and Krivosheina (2011) disagree and provide a detailed diagnosis.

***Parallelomma paridis* Hering, 1923.** This name was synonymized with *P. vittatum* (Meigen) by Šifner (1978). Ozerov (2010, 2014) examined the types of *P. paridis* and upheld the synonymy. Not everyone agrees with this synonymy (Nelson 1990). Finnish CO1 DNA fingerprints (Kahanpää, unpublished) of larvae on *Paris* (Liliaceae) and adults caught among *Dactylorhiza* (Orchidaceae) suggest that two species are involved.

***Phaonia amicula* Villeneuve, 1922.** New to Finland. Recorded as *Phaonia* sp. nr. *halterata* by Winqvist (2011): Ab: Turku, Ruissalo (67093:32336), 3.vii.2008, leg. K. Winqvist, 1 male.

Acknowledgements

I would like to express my appreciation to Dr. Verner Michelsen for his constructive feedback and for identifying the first Finnish specimen of *Phaonia amicula*. Mr. Kaj Winqvist kindly allowed us to include his record of *P. amicula* in this paper.

Abstract

An updated checklist of the genera and species of Anthomyiidae (Diptera) found in Finland is provided.

Keywords

Checklist, Finland, Diptera, Anthomyiidae

Introduction

The family Anthomyiidae is a large and taxonomically difficult group of flies that has for the same reason suffered from unstable taxonomy and nomenclature. A checklist of the anthomyiid species known from pre-war Finland was compiled by their leading regional specialist of calypterate flies Lauri Tiensuu (1906–1980) and published in Frey et al. (1941). The Anthomyiidae were then not recognized as a separate family but combined with the fanniid and true muscid flies in a comprehensive Muscidae family equivalent of the present Muscoidea less Scathophagidae. Tiensuu's list included confirmed records of 199 anthomyiid species classified in 41 genera and subgenera. No less than 34% of the species names and 58% of the genus-group names in that list are

presently replaced by other names for taxonomic and/or nomenclatorial reasons. Most changes were introduced by Hennig (1966–1976) and Michelsen (1985).

The next Finnish checklist of Anthomyiidae by Hackman (1980) was prepared under the influence by two major events. Firstly, 10% of the area of pre-war Finland, notably a major part of Finnish Karelia, had been ceded to the Soviet Union. In consequence, Hackman's list included fewer species: 175 (too few actually, as he missed a few species recorded by Tiensuu (1936) from present Finland). Secondly, the appearance of Hennig's (1966–1976) major revision of Palearctic Anthomyiidae had resulted in numerous name changes and redefinitions of both species and genera. Hackman's list was updated according to Hennig's proposals except for the splitting of newly recognized species complexes.

After the appearance of the 1941-checklist, L. Tiensuu had stopped publishing taxonomic and faunistic papers on Finnish Diptera altogether, although he stayed active all his life as a skilled collector of Finnish Diptera. Apart from W. Hennig's study of some type specimens in the Helsinki Museum and a project on mushroom feeding *Pegomya* (Hackman 1976, 1979; Hackman and Meinander 1979) Finnish anthomyiids were given little attention until the present author in the early 1980's began a long-term study of the species composition and distribution of Anthomyiidae in Fennoscandia and Denmark.

The web-based database *Fauna Europaea* ver. 1.0 released in 2004 included anthomyiid checklists (Michelsen 2004) for all parts of Europe. It was based extensively on literature records, but in respect to Finland and the other Scandinavian countries almost exclusively on personally verified records. The Diptera collection of the Finnish Museum of Natural History, University of Helsinki (MZH) provided most of the data on the Finnish anthomyiid fauna. After several updates, most recently ver. 2.4 from January 2011, the Finnish list of Anthomyiidae (Michelsen 2011) had grown substantially to 273 species (<http://www.faunaeur.org/>). The anthomyiid checklist given below has been further expanded and now contains 289 species. Comparisons with the better known anthomyiid fauna of Sweden and the presence of some species awaiting description suggest that the anthomyiid fauna of Finland may totally comprise 315–325 species.

All nomenclatorial and taxonomic adjustments (new synonyms, misidentifications, changed circumscriptions of species and genera) made since the appearance of Hackman's (1980) checklist are indicated in the following, updated checklist. In agreement with *Fauna Europaea* the genera are listed alphabetically, as existing attempts to split the family into subfamilies and tribes are preliminary and in part poorly substantiated.

Number of described species:

World: Presently *c.* 2000.

Europe: 508 (Michelsen 2011)

Finland: 289 (present paper)

Faunistic knowledge level in Finland: average

Botanophila rotundivalva (Ringdahl, 1937). Misprediction of closely related, still undescribed species first recorded from Ks by Frey (1956).

Delia angustiventris (Zetterstedt, 1845). Misprediction of *Delia nudicosta* (Ringdahl) by Tiensuu (1936).

Delia floricola Robineau-Desvoidy, 1830. An erroneous record introduced by Hennig (1974).

Delia penicillosa Hennig, 1974. An erroneous record introduced by Michelsen (2004).

Lasiomma multisetosum (Ringdahl, 1926). According to Tiensuu (1936) seen from "finnischen Lappland" by O. Ringdahl, but no specimens have been found in the Museum of Zoology, Lund University.

Pegomya glabroides Michelsen, 2008. Listed from Finland (Kuusamo: Kuolajärvi) by Michelsen (2008), but Kuolajärvi (now Kuoloyerari) is presently situated in Russian Murmansk Oblast close to the Finnish border.

Pegomya laticornis (Fallén, 1825) (= *genupuncta* Stein, 1906). Identification inferred by Hendel (1922) from finds of leaf mines on *Arctium* by Linnaniemi (1913). Supposed *Pegomya*-leaf mines on *Arctium* have been reported from Finland several times since then, but no flies have been recovered so far.

Pegomya nigrisquama (Stein, 1888). Identification inferred by Hering (1925) from finds of leaf-mines on *Solidago virgaurea* by Linnaniemi (1913).

Pegomya sociella Stein, 1906. Only recorded from Le: Kilpisjärvi (Tiensuu 1933). Probably a misidentification.

Phorbia bartaki Ackland & Michelsen, 1987. Records by Kahanpää (2013) refer to *P. melania* Ackland & Michelsen.

Acknowledgements

I am grateful to Jere Kahanpää and Jukka Salmela for inviting me to compile the Anthomyiidae part of the new Checklist of the Diptera of Finland. Antti Haarto, Jere Kahanpää and Kaj Winqvist helped me with valuable information about Finnish records of species and Finnish literature.

Abstract

An updated checklist of the superfamilies Oestroidea and Hippoboscoidea recorded from Finland is presented. The checklist covers the following families: Calliphoridae, Rhiniidae, Sarcophagidae, Rhinophoridae, Tachinidae, Oestridae and Hippoboscidae.

Keywords

Checklist, Finland, Diptera, Oestroidea, Hippoboscoidea

Introduction

Oestroidea is a large and diverse superfamily of flies with a variety of life history strategies ranging from saprophages to parasitoids or endoparasites, sometimes even within the family. Some groups, such as certain subfamilies of the Calliphoridae, have also significant veterinary, medical and economical impact. Oestroidea are regarded as monophyletic clade, however the same does not apply to the family of Calliphoridae within Oestroidea (Marinho et al. 2012). Besides Calliphoridae, Oestroidea currently includes

Table 1. Number of species by family.

Family	Number of species in			Level of knowledge
	World (Pape et al. 2011)	Europe	Finland	
Oestroidea:				
Calliphoridae	1525	102	45	good
Rhiniidae	376	12	0–1	good
Sarcophagidae	3094	309	64	average
Rhinophoridae	174	45	5	average
Tachinidae	9626	877	319	average
Oestridae	176	22	8	average
Hippoboscoidea:				
Hippoboscidae s. lat.	782	45	12	average

six other monophyletic families: Rhiniidae, Sarcophagidae, Rhinophoridae, Tachinidae, Oestridae and the non-finnish Mystacinobiidae. Additionally, the subfamilies of Oestridae (Oestrinae, Gasterophilinae) are sometimes treated as full families.

Hippoboscoidea contains the louse flies Hippoboscidae as well as the tropical Glossinidae or tsetse flies. Hippoboscidae is divided to the mammal or bird parasitic louse flies (Hippoboscinae) and batflies (Nycteribiinae, Streblinae). Although batflies have been treated as full families, they seem to be subordinate to the other Hippoboscidae (Kutty et al. 2010). The checklist will therefore follow the family division of Pape et al. 2011.

While world catalogues has been published for Sarcophagidae (Pape 1996) and Hippoboscidae (Dick 2006) only regional (Herting and Dely-Draskovits 1993) or genus-level (O’Hara 2012) catalogues exist for the other oestroid and hippoboscid families. The Finnish species of Oestroidea and Hippoboscoidea were last listed by Hackman (1980). The sarcophagid checklist was updated by Pape (1987a,b) and the calliphorids by Rognes (1991). The updated checklists for Oestridae, Rhinophoridae and Tachinidae follow the taxonomic order of Pape (2001), Herting (1993) and Herting and Dely-Draskovits (1993), respectively.

Excluded species

Aphantorhaphopsis (Ceranthia) selecta (Pandellé, 1894) misidentified

Baumhaueria goniaeformis (Meigen, 1824) misidentified

Bithia geniculata (Zetterstedt, 1844) see Notes

Blepharipoda scutellata (Robineau-Desvoidy, 1830) misidentified

Blondelia piniariae (Hartig, 1838). Specimens reared from the correct host are mentioned

in the notes of Lauri Tiensuu. See Bergström and Bystrowski (2011) for a recent revalidation of this species.

Billaea fortis (Rondani, 1862) a likely misidentification, the specimen cannot be located
Dexia rustica (Fallén, 1816) misidentified
Drino atropivora Robineau-Desvoidy, 1830 not found within present borders
Entomophaga exoleta (Meigen, 1824) misidentified
Graphogaster vestita Rondani, 1868 misidentified
Gymnosoma rotundatum (Linnaeus, 1758) misidentified
Istocheta subcinerea (Borisova-Zinoveva, 1966) misidentified
Leiophora innoxia (Meigen, 1824) specimen lost, but likely a misidentification due to the host record (*Diprion* sp. Symphyta: Diprionidae)
Linnaemya comta (Fallén, 1810) misidentified
Lydella grisescens Robineau-Desvoidy, 1830 misidentified
Macronymchia alpestris Rondani, 1865 labeling mistake
Macronymchia conica Robineau-Desvoidy, 1830 labeling mistake
Macroprosopa atrata (Fallén, 1810) misidentified
Masicera silvatica (Fallén, 1810) misidentified
Oestrus ovis Linnaeus, 1758 extinct?
Opesia cana (Meigen, 1824) not found within present borders
Pseudogonia rufifrons (Wiedemann, 1830) imported
Pseudoperichaeta palesoidea (Robineau-Desvoidy, 1830) misidentified
Sarcophaga agnata Rondani, 1860 misidentified
Sarcophaga dissimilis Meigen, 1826 misidentified
Sarcophaga granulata Kramer, 1908
Sarcophila latifrons (Fallén, 1817) not found within present borders
Senometopia confundens Rondani, 1859 misidentified
Thelymorpha marmorata (Fabricius, 1805), record cannot be confirmed – specimen lost?

Notes

***Athrycia* sp. A.** Probably an undescribed species (J. Flinck leg., T. Zeegers priv. comm.)

***Bithia geniculata* (Zetterstedt, 1844).** Erroneously included in the previous checklist (Hackman 1980, 1981) on the basis of misinterpreted records of *Siphona geniculata* (De Geer, 1776).

***Dexia vacua* (Fallén, 1816)** and ***Dinera carinifrons* (Fallén, 1817).** Conspicuous large species with many historical records, however they have not been seen for decades in Finland (last record for *D. carinifrons* from 1945). While the species have certainly become rarer, their complete extinction cannot be confirmed due to the regional paucity of recording. For example, *Linnaemya rossica* Zimin, 1954 was similarly missing for 50 years until rediscovered in 2013 from Lieksa, eastern Finland.

***Exorista* sp. A.** Probably an undescribed species, near to *E. tubulosa* Herting, 1967 (C. Bergström, pers. comm.)

***Linnaemya* sp. A.** An undescribed species (C. Bergström, pers. comm.). A highly unusual, shiny black *Linneamya* species from Lapland.

Nemorilla floralis (Fallen, 1810). *N. maculosa* (Meigen, 1824) has been mixed with this species on Hackman's (1980) list. True *floralis* was found new to Finland in 2011 from Loviisa (J. Flinck leg.).

Phebellia sp. A. Probably an undescribed species (J. Flinck leg., T. Zeegers priv. comm.)

Stomorhina lunata (Fabricius, 1805). Recorded once from the University Botanical Gardens in Helsinki (2 exx). It is quite possible that the flies were imported to Finland, but the species is also a known vagrant and the possibility of natural dispersal cannot be excluded.

Tachina sp. aff. **magnicornis**. Close to the real *T. magnicornis* of Zetterstedt. The proper name of this species still under investigation, but may be *T. tetramera* (Zetterstedt, 1849). It is common and widespread in Finland. Some records have been confirmed by the DNA barcoding project (Pohjoismäki et al. 2013). See Tschorsnig et al. (2002) and Novotna et al. (2009).
