## Abstract

*Acantholycosa azarkinae* sp. n. is described from the Maritime Province of Russia on the basis of both sexes. *A. norvegica* (Thorell, 1872) is reported from the Maritime Province for the first time. A key and illustrations to all six species that occur in Far East Asia are provided.

## Keywords

spiders, East Palaearctic, Asia, new species, key

## Introduction

*Acantholycosa* Dahl, 1908 is a relatively small Holarctic genus with 26 species and one subspecies (Platnick 2011). It is a well delimited genus that can easily be recognized by having 4–6 pairs of ventral tibial spines on legs I and II, and a modified palea. The genus was recently revised by Marusik et al. (2004). *Acantholycosa* has a rather

unusual geographical distribution, with two centres of species richness, including an extraordinary degree of endemism in the northern Palaearctic (Marusik et al. 2004). Twenty-one species of this genus are known from the Altai-Sayan mountainous region, of which 17 are local endemics. Four species of *Acantholycosa* are known from the Maritime Province (*A. aboriginica* Zyuzin & Marusik, 1998; *A. lignaria* (Clerck, 1757), *A. oligerae* Marusik et al., 2004 and *A. sundukovi* Marusik et al., 2004), two of which are local endemics. No other areas in the Holarctic region have more than two species.

While studying wolf spiders in the Maritime Province of Russia we found two additional species, one of which was new to science. The main aim of this paper is to provide a description of the new species. We also review and provide a key to all species known to occur in the whole of the Russian Far East.

## Material and methods

Specimens were photographed using an Olympus Camedia E-520 camera attached to an Olympus SZX16 stereomicroscope in the Zoological Museum, University of Turku. The images were montaged using “CombineZP” image stacking software. Photographs were taken in dishes of different size with paraffin at the bottom. Different sized holes were made in the bottom to keep the specimens in the required position. Figures 6–7, 13–21, 29–40 are reproduced from Marusik et al. (2004) with permission of the co-authors G.N. Azarkina and S. Koponen, in addition to N. Smirnov, the chief editor of *Arthropoda Selecta*.

The standard of description follows that in Marusik et al. (2004). All measurements are in mm.

The material treated herein will be deposited in the Zoological Museum of the Moscow State University (ZMMU) and in Gornotayozhnaya Station (GTS).

## Species survey

### *Acantholycosa azarkinae* sp. n.

urn:lsid:zoobank.org:act:8E2A95F1-AC1D-4535-8FB1-2202B4897FF0

Figs 1–5, 8–12, 26–28

**Types.** Holotype ♂ and paratypes ♀ (ZMMU) and 1♂ 1♀ (GTS) from Russia, Maritime Province, Lazovski District, Sestra Mt., 43°31'52.23"N, 134°02'49.44"E, 1600 m, scree, 16–23.06.2005 (M.M. Omelko).

**Etymology.** The specific name is a matronym in honor of our friend and colleague Galina N. Azarkina.

**Diagnosis.** The new species can be easily distinguished from other congeners occurring in the Far East by the shape of the palp, which has a broad embolus tip (Figs 8,

**Figures 1–7.** Male palp and leg I of *Acantholycosa azarkinae* sp. n. (1–5), *A. oligerae* (6) and *A. sundukovi* (7). 1, 6, 7 male palp, ventral 2 male palp, retrolateral 3 bulbus, ventral 4 bulbus, retrolateral 5 leg I, prolateral. 6–7 after Marusik et al. (2004). Scale = 0.1 if not otherwise indicated.

10) (not broad in the other species) and by the shape of the epigyne, which has a broad apical pocket and well developed hoods (Figs 26–28).

**Comments.** *A. azarkinae* sp. n. is morphologically close to two other endemic species that occur in the Maritime Province: *A. oligerae* and *A. sundukovi*. The three species have similar male palps although they differ from one another by the shape of the tegular apophysis and the embolus.

**Description** (male(female)). Total length 8.0(8.9). Carapace: 3.7(3.6) long, 3.4(3.1) wide. Carapace and abdomen blackish brown, pattern indistinct. Femora I in both sexes with dark semicircles. Males darker than females. Male leg I with dense black

**Figures 8–21.** Male palp of *Acantholycosa azarkinae* sp. n. (8–12), *A. oligerae* (13–14, 20–21) and *A. sundukovi* (15–16, 17–19). 8 bulbus, from above 9, 13, 15 terminal part of palp, ventral 10 terminal part of palp, from above 11 tegulum, from above 12, 14, 16 terminal part of palp, retrolateral 17, 20 regular apophysis, ventral 18, 21 embolus, from above 19 terminal part of embolus and terminal apophysis. 13–21 after Marusik et al. (2004). Scale = 0.1 mm if not otherwise indicated. Abbreviations: Bs = basal spine of embolus.

hairs on all segments except for tarsus (Fig. 5). Leg II also with hairs but less dense. Carapace/femur I ratio 1.06(1.0). Leg I segments: 3.5(3.6) + 1.5(1.6) + 3.5(3.5) + 3.5(3.2) + 1.7(1.5). Femur I with 2 dorsal, 2 pro- and 2 retrolateral spines; patella with 1 retrolateral spine (0 in female); tibia I with 1 prolateral and 5 pairs of ventral spines (1p, 1r, 5–5v in females); metatarsus with 1 pro-, 1 retrolateral and 2 pairs of ventral spines.

Male palp as in Figs 1–4, 8–12. Cymbium with 3 claws, regular apophysis without apical arm, palea with laminar outgrowth, terminal apophysis large with claw-like tip;

**Figures 22–25.** Male palp of *Acantholycosa aborigenica* (22), *A. lignaria* (23) and *A. norvegica* (24–25). 22–23 ventral 24 bulbus, ventral 25 base of embolus showing tooth. All after Marusik et al. (2004). Scale = 0.1 mm. Abbreviations: *Bs* = basal spine of embolus.

embolic base with small, almost indistinct “spine”, tip of embolus widened and subdivided into two lobes.

Epigyne as in Figs 26–28. Apical pocket wide with two distinct hoods, septum distinct, septum with trapezoidal base; spermathecae long, with blind outgrowth in basal third.

**Distribution.** Type locality only.

***Acantholycosa aborigenica* Zyuzin & Marusik, 1988**

Figs 22, 35–36

*A. a.* Zyuzin and Marusik 1988: 1083, f. 1–6 (♂♀).

*A. a.*: Marusik et al. 2004: 123, f. 108–114, 125–127, 147–151 (♂♀).

**Material examined.** 4♂ 3♀ (GTS), Russia, Maritime Province, Ussuriyski District, environs of Gornotaezhnoe Village, Kamenistaya Sopka, 43°42'22.02"N 132°07'30.93"E, 218 m, stones, 19–26.06.2010 (M.M. Omelko); 3♂ (GTS), same locality, 02.07.2010 (M.M. Omelko).

**Comments.** This species has been well described in the two publications mentioned above. It is distributed from Central Aimak in Mongolia to Kolyma River, and south to Maritime Province (Marusik et al. 2004). Within the Far East it has been reported from the upper Kolyma, northern Cisokhotia, as well as from the Khasan and Ussuriyski districts of Maritime Province.

**Figures 26–34.** Epigyne of *Acantholycosa azarkinae* sp. n. (26–28), *A. oligerae* (29–30), *A. norvegica* (31–32) and *A. lignaria* (33–34). 26, 28–29, 31, 33 epigyne, ventral 27, 30, 32, 34 vulva, dorsal. 27–28, 30, 32, 34 after maceration. 29–34 after Marusik et al. (2004). Scale = 0.1 mm if not otherwise indicated.

*Acantholycosa lignaria* (Clerck, 1757)

Figs 23, 33–34, 37

*A. l.*: Holm 1947: 37, pl. 8, f. 82–83, pl. 10, f. 47 (♂♀).

*A. l.*: Marusik et al. 2004: 119, f. 27–29, 54, 115–121 (♂♀).

**Material examined.** 2♀ (GTS), Russia, Maritime Province, Chuguevskii District, Oblachnaya Mt., 43°41'43.75"N 134°12'00.04"E, 600 m, fallen tree-trunks, 11–15.08.2003 (M.M. Omelko).

**Comments.** This species has been well described in several publications. It has a trans-Palaearctic range (Marusik et al. 2004). Previously it was reported from Ussuri

**Figures 35–40.** SEM microphotographs of epigyne of *Acantholycosa aborigenica* (35–36), *A. lignaria* (37), *A. norvegica* (38–39) and *A. oligerae* (40). All after Marusik et al. (2004). Scale = 0.1 mm.

Reserve (Marusik et al. 2004). Unlike other *Acantholycosa* species this species lives in habitats without stones. From other congeners it can be easily distinguished by having only 4 pairs of ventral tibial spines (other species have 5–6 pairs).

***Acantholycosa norvegica* (Thorell, 1872)**

Figs 24–25, 31–32, 38–39

*A. n.*: Holm 1947: 38, f. 4a, 15–16, pl. 8, f. 84–85 (♂♀).

*A. n.*: Marusik et al. 2004: 128, f. 92–97, 122–124, 168–172, 181–182 (♂♀).

**Material examined.** 5♂ 3♀ (GTS), Russia, Maritime Province, Chuguevskii District, Oblachnaya Mt., 43°41'43.75"N 134°12'00.04"E, 1750 m, high mountain birch wood, 23.06.2008, (M.M. Omelko); 39♂ 4♀ (GTS), same locality, bush thicket, 23.06.2008 (M.M. Omelko).

**Comments.** *A. norvegica* is the type species of the genus. It has been well described in several publications. This species has a trans-Palaearctic range. Although it has a wide range and is known from the adjacent Khabarovsk Province (Trilikauskas 2007) and the more eastern Magadan Area, it has not previously been reported from the

Maritime Province. It is worth mentioning that the record from Maritime Province is the southernmost of its known range.

***Acantholycosa oligerae* Marusik, Azarkina & Koponen, 2004**

Figs 13–14, 20–21, 26, 29–30, 40

*A. o.* Marusik et al. 2004: 126, f. 19–20, 128, 152–161 (♂♀).

**Comments.** This species was recently described from material found at a single locality in the Lazo Reserve, the Russian Far East.

***Acantholycosa sundukovi* Marusik, Azarkina & Koponen, 2004**

Figs 15–16, 17–19

*A. s.* Marusik et al. 2004: 128, f. 162–167 (♂).

**Comments.** This species is known from the holotype male only. So far, *A. sundukovi* is known from a single locality in the Lazo Reserve (Kordon Amerika), the Russian Far East.

**Key to the Far Eastern *Acantholycosa***

- Fovea with straight sides (Figs 26–28), apical pocket with two distinct hoods ..... *A. azarkinae* sp.n.

## Conclusions

The number of *Acantholycosa* species in the Maritime Province of Russia is fewer than that of the Altai-Sayan region only, with 6 and 21 species respectively. The same is true for the number of endemic species (3 and 17 respectively). Presently, only the southern region of the Maritime Province has been relatively well studied. The huge territories of Sikhote-Alin remain uninvestigated. Given the high level of endemism among petrophilous species of spiders it is reasonable to expect the occurrence of additional new species in the province, especially on isolated screes on mountain tops.

## Acknowledgements

We thank Seppo Koponen who arranged the stay of both of us in Turku and allowed us to use local facilities (SEM and digital photomicroscopy). English of the final draft was kindly checked by David Penney. This work was supported in part by the RFFI grants # 09-04-01365 and 11-04-01716.
