Abstract
The flying squirrels of the tribe Pteromyini (Family Sciuridae) currently include 15 genera of which the genus Biswamoyopterus comprises two recognized species, B. biswasi Saha, 1981 and B. laoensis Sanamxay et al., 2013. These two species were each described from only one specimen that are separated from each other by 1,250 kilometres in southern Asia, where they occur in northeast India and central Lao PDR respectively. In 2017 and 2018, two specimens of Biswamoyopterus were discovered from Mount Gaoligong, west Yunnan province, southwest China (between the type locality of the two recognized species). This study aimed to evaluate the taxonomic status of these two newly acquired specimens of Biswamoyopterus by comparing their morphology with the two described species of the genus. The results of this study showed that the specimens from Yunnan province (China) differed from...
both *B. laoensis* and *B. biswasi* in both pelage colour and craniology, and should be recognised as a distinct species, *B. gaoligongensis* sp. nov., which is formally described here. This study contributes to the understanding of the flying squirrels of southern Asia and identifies an additional species that appears to be endemic to southwest China; however, more research is required to provide details of its ecology, distribution, and conservation status.

Biodiversity, conservation, mammal, Pteromyini, systematics, taxonomy, threatened, wildlife, Yunnan

**Introduction**

The flying squirrels of the tribe Pteromyini (Family Sciuridae) currently comprise 52 species of recent mammals that are placed in 15 genera. A number of fossil species have also been described and includes in several of the genera containing extant species as well as 13 additional extinct genera (Jackson and Thorington 2012; Jackson and Schouten 2012; Koprowski et al. 2016). The genus *Biswamoyopterus* Saha, 1981 is the most recently described in the tribe and initially only included *Biswamoyopterus biswasi* Saha, 1981 based on a single specimen collected in Namdapha National Park, northeast India (Saha 1981). *Biswamoyopterus biswasi* was placed in its own genus by Saha (1981) as it was considered to exhibit a unique combination of characters that distinguish it from other genera including: 1) large body size, cylindrical tail, and well-developed uropatagium (tail membrane or interfemoral membrane) similar to *Petaurista*, *Aeretes* and *Aeromys*; 2) the presence of ear tufts similar to *Belomys* and *Trogopterus*; and 3) cuspidate brachyodont dentition similar to *Hylopetes* and *Aeromys*.

In addition to these characters, *Biswamoyopterus* was recognised to have pale-yellow incisors similar to *Aeromys* and *Eupetaurus* (Corbet and Hill 1992). In reference to these characters, Sanamxay et al. (2013) described a second species of *Biswamoyopterus* (*B. laoensis*) based on a single specimen collected from central Lao PDR. So far, all knowledge of *Biswamoyopterus* comes from the morphological description of these two holotypes. As a result, the International Union for Conservation of Nature (IUCN) listed *Biswamoyopterus biswasi* as critically endangered due to hunting and habitat loss from logging (Molur 2016) and *Biswamoyopterus laoensis* as data deficient (Kennerley 2017).

There is a gap of 1,250 km between the type localities of the two described *Biswamoyopterus* species (Sanamxay et al. 2013). Western Yunnan, southwest China occurs between the two type localities of *Biswamoyopterus* (Fig. 1). In 2017 and 2018, two specimens of *Biswamoyopterus* sp. were collected in Mount Gaoligong (the watershed of the Irrawaddy River and the Nu River [Salween River]), west Yunnan (Fig. 1) that appeared to have different pelage and cranial characters from the two described species of *Biswamoyopterus*. Therefore, the aim of this study was to: 1) undertake a detailed comparison of the specimens collected in Yunnan province, China with the two described species; and 2) if these Yunnan specimens proved to be distinct, formally describe and name a new species of *Biswamoyopterus*. 
A new species of flying squirrel (Biswamoyopterus) from Southwest China

Materials and methods

Ethics statement

Animals used for this study were approved by the Animal Ethics Committee of the Kunming Institute of Zoology, Chinese Academy of Sciences (approval ID: SMKX2018021).

Repositories

ZSI Zoological Collection of the Zoological Survey of India, Kolkata [Calcutta], India.

NUoL Zoological collection of the Faculty of Environmental Sciences, National University of Laos, Vientiane, Lao PDR.

KIZ Kunming Natural History Museum of Zoology, Kunming Institute of Zoology, Chinese Academy of Sciences, Kunming, China.

Specimens examined

Holotype

CHINA • 1♂, holotype of Biswamoyopterus gaoligongensis sp. nov., skin and skull available; Yunnan province, Baoshan city, Longyang county, Lujiang township, Baihua-lin village; 25.298N, 98.785E; 2040 m a.s.l.; Jan. 2017; Quan Li leg.; Broad-leaved evergreen forests; KIZ 034924 (field No. bs1628).

INDIA • 1♂, holotype of Biswamoyopterus biswasi, skin and skull available; Tirap District, Namdapha, 26 km east of Miao, Deban; ca. 350 m a.s.l.; Apr. 1981; Shyamrup Biswas leg.; collected from a tall Nahar tree (Mesua ferrea) at 20:15 pm; ZSI 20705.
LAO PDR • 1♀, holotype of *Biswamoyopterus laoensis*, skin and skull available; Bolikhamsai Province, Pak Kading District, Ban (village) Thongnami, Thongnami market (Purchased from the market by the collectors. The collectors speculated that the original collection site might be Nam Kading National Biodiversity Conservation Areas or Khammouan Limestone National Biodiversity Conservation Areas (NBCA), which is about 5 km Northeast of Thongnami and Khammouan Limestone NBCA, and about 25 km Southeast of Ban village); 18.172N, 104.24E; Sep. 2012; Daosavanh Sanamxay, Sysouphanh Xayavong, and Vilakhan Xayaphet leg.; NUoL FES.MM.12.163.

Paratype
CHINA • 1 sex unknown, paratype of *Biswamoyopterus gaoligongensis* sp. nov., skin of head and skull available; same locality as for KIZ 034924; Dec. 2018; a native of the area leg.; KIZ 035622 (field No. 201812001).

**Morphological techniques**

The external and craniodental measurements of type specimen of *Biswamoyopterus biswasi* and *Biswamoyopterus laoensis* were employed from the literature (Saha 1981; Sanamxay et al. 2013). External measurements of *Biswamoyopterus* sp. nov. were copied from the label tied on the specimen, included body mass, head and body length, tail length, hind feet length, and ear length. Craniodental measurements of *Biswamoyopterus* sp. nov. were taken with digital caliper to the nearest 0.01 mm; the mensural points follow Saha (1981) and Sanamxay et al. (2013) to facilitate the subsequent comparison (Fig. 2). A total of 28 craniodental measurements were used, including:

- BB: Breadth of braincase
- BH: Braincase height
- CBL: Condylobasal length
- DL: Diastema length
- FL: Frontal length
- GPB: Greatest palatal breadth
- IBG: Inter bullae gap
- IOB: Interorbital breadth
- LAB: Length of auditory bulla
- LBP: Length of bony palate
- LIF: Length of the incisive foramina
- MB: Mastoid breadth
- MH: Mandible height
- ML: Mandible length
- MRTL: Mandibular tooth row length
- MWN: Maximum width of nasals
- MYTL: Maxillary tooth row length
- NL: Nasal length
- OB: Orbit breadth
- ONL: Occipitonasal length
- PL: Palate length
- POB: Postorbital breadth
- PPL: Postpalatal length
- RB: Rostrum breadth
- WAAM: Width of auditory bullae across the external auditory meati
- WPFM: Width of the bony palate at the first upper molar
- ZB: Zygomatic breadth
- ZH: Zygomatic height
- P: Premolars
- M: Molars

Superscript (P$^x$, M$^x$) upper premolars and upper molars, and
Subscript (P$_x$, M$_x$) lower premolars and lower molars.
The nomenclature of cheek teeth structures followed Tong (2007) and Thorington et al. (1996) (Fig. 3).

Pelage colour comparisons were made among all four available specimens. Skull and teeth were studied using a stereo binocular microscope. As only four skull specimens were available, statistical analysis was not possible.

**Taxonomy**

Class Mammalia Linnaeus, 1758  
Order Rodentia Bowdich, 1821  
Family Sciuridae Fischer, 1817  
Subfamily Sciurinae Fischer, 1817  
Tribe Pteromyini Brandt, 1855  
Genus *Biswamoyopterus* Saha, 1981

*Biswamoyopterus gaoligongensis* sp. nov.  
http://zoobank.org/21C9D58C-EDC9-4016-8148-3F81DB51D9D3

Common name. Mount Gaoligong Flying Squirrel. Chinese common name "高黎贡比氏鼯鼠".

Holotype. Specimen KIZ: 034924 (field number bs1628), an adult male, skull, dried skin, baculum, and remaining body part in alcohol deposited in the Kunming
Figure 3. Nomenclature of cheek teeth of *Biswamoyopterus*. Maxillary tooth row (top), Mandibular tooth row (bottom).

Natural History Museum of Zoology, Kunming Institute of Zoology, Chinese Academy of Science (KIZ).

**Type locality.** Baihualin village [25.298167N, 98.784683E], Lujiang township, Longyang County, Baoshan City, Yunnan, China. The locality is located on the eastern slope of the southern Mount Gaoligong.

**Etymology.** The specific name is derived from Mount Gaoligong, the type locality of the new species and –*ensis*, Latin for belonging to.

**Diagnosis.** *Biswamoyopterus gaoligongensis* sp. nov. can be distinguished from the other two described species of *Biswamoyopterus* by the following combination of traits: 1) The ear tufts at the base of the posterior margins of ears are bicolored, basally white and terminal black. The scrotum is dark brown which strongly contrasts with the yellowish-white abdominal pelage. 2) The muzzle is very short, and the zygomatic arch is distinctly expanding outward, making the outline of the skull short and wide. The outer margin of the nasal bone, the orbital margin of the frontal bone, and the post-orbital margin of the frontal bone are almost parallel to the midline of skull on the
dorsal view. The central point of the posterior margin of the palatal bones lies in front of the posterior margin of M³. 3) M¹ and M² are sub-square in outline, and as large as P⁴. The hypoconid of P₄-M₂ are very developed, strongly pointed towards posterior buccal side.

**Description.** *Biswamoyopterus gaoligongensis* sp. nov. is a large flying squirrel (head and body length: 440 mm, tail length: 520 mm, and body mass: 1370 g) with a very developed uropatagium that extends approximately one-third of the proximal tail length in fresh specimen (Fig. 4). The back and upper surface of patagium are predominantly reddish brown, while the back between the shoulder and uropatagium is speckled with numerous white-tip furs that are absent from the head, shoulder, plagiopatagium, outer edge of uropatagium, limbs, and tail (Fig. 4). Similar to the shoulder, the head is reddish brown, but showing some yellowish grey in the crown. The ear is naked, with two bunches of long hairs (i.e., ear tufts) at the ear base, the anterior tufts are black, and the posterior tufts are basally white and terminal black. The back of each manus is reddish brown and the digits are black, while the whole pes and digits are black. The tail is cylindrical, the part beyond the uropatagium is black, and the part within the uropatagium is the same colour as the uropatagium. Throat, belly, and ventral surface of patagium are yellowish white. However, the scrotum is dark brown which strongly contrasts with the abdominal pelage.

Skull is large with a short muzzle and an expanded outward zygomatic arch, making the outline of skull short and wide (Fig. 5). The frontal depression is deep and postorbital processes are large and well developed. The outer margin of the nasal bone, the orbital margin of the frontal bone, and the post-orbital margin of the frontal bone are almost parallel to the midline of skull on the dorsal view. The auditory bullae are relatively large, with a honeycomb pattern of complex septae. The intermaxillary foramen is well opened, which is not common in most flying squirrel genera. The mandible is generally similar to that of other flying squirrels. The coronoid process is less developed, only slightly higher than condylar process when the mandible is placed on a plane.

The anterior surface of incisors is pale yellow. Cheek teeth are strongly cuspidate brachyodont, with slightly pitted enamel.

Maxillary teeth: P³ is strong and unicuspide. Parastyle is prominent on P⁴ and dwindle on the following molars in an anterior to posterior gradient. Paracone is prominent on P⁴, M¹, M², and M³. Metacone is prominent on P⁴, M¹, and M², and indistinct on M³. Between protocone and metacone, at the exit of the middle valley of P⁴, M¹, M², and M³, there are two mesostyles form a projecting gutter. Protocone is prominent on P⁴, M¹, M², and M³. Hypocone is small, separated from protocone by a notch, distinct on M¹ and M², small on P⁴, and absent on M³. The anteroloph and posteroloph are indistinct on P⁴ and M³; distinct on M¹ and M², but they do not develop into a ridge as high as the protoloph and metaloph. A protoloph connecting the protocone with the paracone on M¹, M², and M³, and notched on P⁴. A metaloph connecting the protocone with the metacone on M², interrupted by one big or two small metaconules on P⁴ and M¹, and absent on M³.
Figure 4. Skins of the three known Biswamoyopterus species A, B (ZSI 20705, holotype) Biswamoyopterus biswasi C, D (KIZ 034924, holotype) Biswamoyopterus gaoligongensis sp. nov. E, F (NUoL FES. MM.12.163, holotype) Biswamoyopterus laoensis. The images E, F were derived from Sanamxay et al. (2013).

Mandibular teeth: Four main cusps (protoconid, hypoconid, metaconid, and entoconid) are all distinct on P₄, M₁, M₂, and M₃. Mesoconid is present on the buccal side of P₄, M₁, M₂, and M₃, the notch between mesoconid and hypoconid is distinct, seems to be formed by the intense wear and tear. Mesostylid is small and fused with metaconid on P₄ and M₁, indistinct on M₂ and M₃.

Comparison. Body size, B. gaoligongensis sp. nov. is similar to B. biswasi but clearly smaller than B. laoensis (Table 1). Pelage colour becomes dark gradually from B. biswasi to B. gaoligongensis sp. nov. and to B. laoensis. The back, B. biswasi is morocco-red speckled with white, B. gaoligongensis sp. nov. is reddish brown speckled with white, and B. laoensis is dark reddish brown speckled with white. The belly, B. biswasi is white, B. gaoligongensis sp. nov. is yellowish-white, and B. laoensis is pale orange. The tail beyond uropatagium, B. biswasi is pale smoky grey, with a dark tip, both B. gaoligongensis sp. nov. and B. laoensis are black (Fig. 4). The ear tufts, B. biswasi are white, B. gaoligongensis
A new species of flying squirrel (Biswamoyopterus) from Southwest China

sp. nov. are bicolour (the anterior tufts are black, and the posterior tufts are basally white and terminal black), and *B. laoensis* are black (Fig. 6).

The muzzle of *B. gaoligongensis* sp. nov. is very short, *B. biswasi* is intermediate, and *B. laoensis* is much longer (Fig. 5, Table 1). As a result, the outline of skull of *B. gaoligongensis* sp. nov. is short and wide, *B. biswasi* is relatively short, and *B. laoensis* appears

Figure 5. Skulls, left maxillary (above) and left mandibular (below) tooth rows of the three known *Biswamoyopterus* species. A (ZSI 20705, holotype) *Biswamoyopterus biswasi* B (KIZ 034924, holotype) *Biswamoyopterus gaoligongensis* sp. nov. C (NUoL FES.MM.12.163, holotype) *Biswamoyopterus laoensis*. The images of C were derived from Sanamxay et al. (2013).

long. On the dorsal view of skull, the outer margin of the nasal bone, the orbital margin of the frontal bone, and the post orbital margin of the frontal bone of *B. gaoligongensis* sp. nov. are almost parallel to the midline of skull, while *B. biswasi* slanted, and *B. laoensis* slanted even more. The postorbital processes of *B. gaoligongensis* sp. nov. and *B. biswasi* are clearly larger than *B. laoensis*. The preglenoid process of *B. gaoligongensis* sp. nov. and *B. laoensis* are almost flat, whereas that of *B. biswasi* obviously protruding forward (Fig. 7). The sutures of frontal and squamosal bone of *B. gaoligongensis* sp. nov. are bulging, while *B. biswasi* and *B. laoensis* are almost flat. The auditory bullae of
A new species of flying squirrel (Biswamoyopterus) from Southwest China

B. gaoligongensis sp. nov. and B. biswasi are distinctly smaller than those of B. laoensis. The posterior margin of the palatal bones of B. gaoligongensis sp. nov. and B. biswasi is concave forward, while B. laoensis is flat. The central point of the posterior margin of the palatal bones of B. gaoligongensis sp. nov. lies in front of the posterior margin of M3, B. biswasi just meet, and B. laoensis lies behind (Fig. 7).

The metacone and hypocone of M1 and M2 of B. gaoligongensis sp. nov. are most developed among three species, followed by B. laoensis, again B. biswasi. As a result, M1 and M2 of B. gaoligongensis sp. nov. are almost equal to P4, while those of B. laoensis and B. biswasi are smaller than P4. In addition, the outline of M1 and M2 of B. gaoligongensis sp. nov. is sub-square, B. laoensis is sub-rectangle, and B. biswasi is sub-triangular. The hypoconid of B. gaoligongensis sp. nov. is strongest among three species, followed by B. biswasi, again B. laoensis (Fig. 5).
**Distribution.** Apart from the locality of the holotype, there are two more localities in Yunnan, China, where the *Biswamoyopterus gaoligongensis* sp. nov. was photographed. These include Linjiapu (25.28693N, 98.70102E), 10 km west of the type locality; and Banchang (25.145876N, 98.796026E), 9 km south of the type locality (Fig. 1). Although these three localities cover the east and west slopes of Mount Gaoligong (the watershed of the Irrawaddy River and the Nu River [Salween River]), they are all restricted in a small area of southern Mount Gaoligong.

**Natural history.** Little is known about the natural history of *Biswamoyopterus gaoligongensis* sp. nov. The holotype was collected from evergreen broad-leaved forest at an altitude of 2,000 meters above sea level. A set of photos taken in Linjiapu showed a *Biswamoyopterus gaoligongensis* sp. nov. resting on the branches of *Daphniphyllum* sp. *Petaurista yunanensis*, *P. elegans*, and *Hylopetes alboniger* were also collected in the same habitat where the holotype was collected.

**Conservation status.** The limited available information suggests that *Biswamoyopterus gaoligongensis* sp. nov. has a relatively low abundance. Because low-altitude forests inhabited by *Biswamoyopterus gaoligongensis* sp. nov. are close to human settlements, they are vulnerable to human activities. The currently known threats are agricultural reclamation and poaching.

---

**Key to the three known species of Biswamoyopterus**

1. Pale orange belly and marked with numerous, black, discontinuous lines; ear tufts black; long muzzle; large auditory bulla; the posterior edge of the palatal bones is flat. ...................................................... *Biswamoyopterus laoensis*

   – Light-coloured belly; ear tufts bicolour or white; short muzzle; smaller auditory bulla; the posterior edge of the palatal bones is concave forward........... 2

2. Parti-coloured tail with a dark tip; ear tufts white; the central point of the posterior margin of the palatal bones just meet the posterior margin of M3; the outline of M1 and M2 is sub-triangular; smaller hypoconid ..................

   ................................................................. *Biswamoyopterus biswasi*

   – Black tail; ear tufts bicolour; the central point of the posterior margin of the palatal bones lies in front of the posterior margin of M3; the outline of M1 and M2 is sub-square; strong hypoconid ..........................

   ................................................................. *Biswamoyopterus gaoligongensis* sp. nov.

---

**Discussion**

This study describes a third species of *Biswamoyopterus* in the middle of the isolated ranges of two previously known species, suggesting that the distribution of *Biswamoyopterus* is much broader than previously known. Although the genetic analysis within *Biswamoyopterus* was not available in this study, the morphological comparison shows that *Biswamoyopterus gaoligongensis* sp. nov. markedly differs from *Biswamoyopterus bis-
A new species of flying squirrel (Biswamoyopterus) from Southwest China

wasi and Biswamoyopterus laoensis in pelage colour and craniodental traits (Figs 4, 5; Table 2). Within the distribution of Biswamoyopterus and adjacent areas (Fig. 1), they occur sympatrically with a number of flying squirrels including Belomys pearsonii, Eu-petaurus sp., Hylopetes alboniger, H. phayrei, Petaurista alborufus, P. caniceps, P. elegans, P. petaurista, P. philippensis, P. yunanensis and Trogopterus xanthipes (Jackson and Thor-ington 2012; Jackson and Schouten 2012). This high diversity of both genera and species may be the result of the region acted both as refugia and diversification centre since the late Miocene (Lu et al. 2013; Mercer and Roth 2003).

Acknowledgements

We thank Mr. Dazhou Peng, Mr. Jinlin Qian, and Mr. Chunliao Qian for their assistance in the field. We are grateful to Dr. Rong Li for identification of plant species, and Dr. Qigao Jiangzuo for some morphologic terms. We appreciate Baoshan Management Bureau of Gaoligongshan National Nature Reserve for their assistance in field work. Our research is supported by National Key Research and Development Program of China (#2017YFC0505202) and the Yunnan University “Double First-Class” Construction Program (C176240107).
