Abstract

The genus *Bellatrachia* Schileyko, 2018 was described based on a specimen identified as *Helix (Chloritis) pseudomiara* Bavay & Dautzenberg, 1909. We concluded that the examined specimen is not that species, but *Helix condoriana* Crosse & Fischer, 1863. Therefore, (1) the type species of *Bellatrachia* must be replaced with *Helix condoriana*; (2) the species *Helix (Chloritis) pseudomiara* must be re-allocated to the genus *Trichochloritis*; (3) the erroneous treatment of the genus *Trichochloritis* by Schileyko (2007) needs to be corrected through the description of a new genus, *Dentichloritis* gen. nov. based on *Helix brevidens* Sowerby I, 1841. In addition, *Chloritis microtricha* Möllendorff, 1898 is treated as a synonym of *Helix condoriana*, and further information on the genitalia of *Chloritis (?) bifoveata* (Benson, 1856) is presented.

Land snail, nomenclature, Southeast Asia, systematics, taxonomy

Introduction

Almost 20 years ago, the second author of this work became fascinated by the enormously rich shell collection of Colonel Messager (see Breure and Páll-Gergely 2019) from northern Vietnam and Laos housed in the MNHN. While many type specimens taken from Messager’s collection were distributed through the activities of the describ-
ing authors to other institutions, the main body of the collection remained untouched in Paris. At the suggestion of the first author, we started to systematically compile data on the haired camaenid species of Southeast Asia.

This group was traditionally classified in the genera *Trichochloritis* Pilsbry, 1891 and *Trachia* E. von Martens, 1860 (Richardson 1985; Schileyko 2011; Wu et al. 2019); however, it was clear from the beginning that haired and non-haired shells are present in many camaenid genera, that the current classification is rather a paraphyletic “wastebasket taxon”, and that only the investigation of the morphology of the genital organs in combination with genetic data will recover the correct phylogenetic relationships. Nonetheless, even current modern research can add to the confusion rather than unravelling some of the old errors.

According to Schileyko (2007), the genus *Trichochloritis* consists of 10–12 species from southern China, Indochina Peninsula, and the Philippines. He published an illustration (drawing) of the shell of the type species, *H. breviseta* (Schileyko 2007: fig. 2032a), and added drawings of the reproductive anatomy of *H. brevidens* Sowerby I, 1841 (Schileyko 2007: fig. 2032b–c) as representative of *Trichochloritis*. However, the morphology of the genital organs of the latter species differs strongly from the conchologically similar genera as used here (*Trichochloritis*, *Bellatrachia*) from Continental Asia. In 2018, Schileykodescribed the monotypic genus *Bellatrachia*, a genus which was introduced based on conchological characters and traits of the genital anatomy of *Helix* (*Chloritis*) *pseudomiara* Bavay & Dautzenberg, 1909. Unfortunately, the anatomically examined specimen, which was collected in the Cat Tien National Park, southern Vietnam, was misidentified: in fact, Schileyko’s (2018) specimen is *Helix condoriana* Crosse & Fischer, 1863.

These misidentifications and errors have nomenclatorial and taxonomical consequences: 1) the type species of *Bellatrachia* must be replaced; 2) the species *Helix* (*Chloritis*) *pseudomiara* Bavay & Dautzenberg, 1909 must be re-allocated in the genus *Trichochloritis*; 3) the erroneous treatment of the genus *Trichochloritis* by Schileyko (2007) needs to be corrected through the description of a new genus, *Dentichloritis* nov. gen. based on *Helix brevidens* Sowerby I, 1841. In addition, the position of two continental species usually confined to *Chloritis* Beck, 1837, is discussed.

**Materials and methods**

An ethanol-preserved specimen of *Chloritis (?) bifoveata* (Benson, 1856) was dissected under a Leica stereo microscope with a camera attachment to provide photographs of the external genital structure, from which drawings were produced. The inner structure of reproductive organs was illustrated from photographs.

Taxonomy

Family Camaenidae Pilsbry, 1893

Genus Bellatrachia Schileyko, 2018

Type species. Helix (Chloritis) pseudomiara Bavay & Dautzenberg, 1909 by monotypy.

The anatomically-examined specimen (i.e., on which the genus is based) was in fact Helix condoriana. Under the provisions of Article 70.3 ICZN, we herewith replace the original type species Helix (Chloritis) pseudomiara Bavay & Dautzenberg, 1909 with Helix condoriana Crosse & Fischer, 1863 as the type species of Bellatrachia Schileyko, 2018 to serve the stability of nomenclature.

Included species. Bellatrachia condoriana (Crosse & Fischer, 1863).

Diagnosis. Shell depressed globular, apex not sunken, hairs or hair scars cover the entire shell. Penis rather long, subcylindrical, its inner surface bears longitudinal pilasters; penial verge absent; penial caecum absent; epiphallus slender, long, convoluted; retractor muscle attached at the penis-epiphallus transition; flagellum thick, with attenuated tip, approximately 2–2.5 times shorter than epiphallus; vagina slender, shorter than penis; stalk of bursa copulatrix long, with thickening at some distance from its origin, shape of bursa unknown (based on Schileyko2018; see Fig. 4).

Description. See B. condoriana below.

Remarks. Bellatrachia differs from Trichochloritis in lacking the penial caecum.
Bellatrachia condoriana (Crosse & Fischer, 1863)

Figs 1–4

Bellatrachia condoriana Crosse & Fischer, 1863: 351, pl. 14, fig. 1.
Helix condoriana Crosse & Fischer, 1863: 351, pl. 14, fig. 1.
Chloritis microtricha Möllendorff, 1898: 71. syn. nov.
Chloritis (Trichochloritis) microtricha: Zilch 1966: 304, pl. 9, fig. 23.
Trichochloritis microtricha: Schileyko2011: 47.
Trichochloritis condoriana: Schileyko2011: 47.

Type specimens. condoriana: 1 syntype MNHN-IM-2000-1866, Poulo-Condor, D: 18.3 mm, H: 11.7 mm [this is the syntype figured in the original description]; microtricha: lectotype (selected by Zilch 1966) SMF 8540, Vietnam, Annam, Boloven, coll. O. Möllendorff ex coll. Roebelen, D: 24.8 mm, H: 17.7 mm.

Type locality. “insula Poulo-Condor” [Con Son Island], Vietnam.

Diagnosis. Shell biconvex with a whitish subsutural spiral, narrow umbilicus, and hair scars covering the entire surface.

Description. Shell middle sized, biconvex, moderately thin-walled; last whorl only slightly expanding and descending abruptly towards aperture; colour dirty yellowish with a broad pale subsutural spiral band; whorls 4.5–5, separated by a rather shallow suture; body whorl faintly slightly angled; subsutural furrow shallow but present on the complete last whorl; protoconch consists of 1.25–1.5 whors, very finely squamous, matte; the pattern of hair scars is dense and covers the complete teleoconch; aperture obliquely rounded, and the peristomal rims are close; peristome strongly expanded and somewhat reflected and reinforced by a white lip; parietal side with very thin, inconspicuous light layer; umbilicus open, of medium size, with blunt peripheral angulation, and partly covered by the columellar reflection.

Measurements. D = 18.3–24.8 mm; H= 11.7–17.7 mm (n = 4).

Remarks. The syntype of B. condoriana (Fig. 1) is similar to the specimen identified as Helix (Chloritis) pseudomiara by Schileyko(2017) (Fig. 3), but the shell of the latter is somewhat more depressed. The shell of the lectotype of B. microtricha (Fig. 2) is larger and somewhat more globular that that of B. condoriana. However, both taxa agree quite well in other details such as the relative size of the umbilicus, formation of lip and aperture, and microsculpture of the teleoconch. In contrast, absolute dimensions proved to be insufficient traits for species-level distinction. Therefore, we consider Chloritis microtricha as a synonym of Bellatrachia condoriana. The subtle conchological differences in the shell morphology shown in Figs 1–3 may be part of the overall variation of B. condoriana or may signal a difference at the species level. This question can only be clarified by a revision of a larger number of specimens from the area.
Genus *Trichochloritis* Pilsbry, 1891

*Trichochloritis* Pilsbry, 1891: 267.

**Type species.** *Helix breviseta* L. Pfeiffer, 1862 by original designation.
Figures 3–4. Original specimen “Bellatchia pseudomiana” sensu Schileyko3 shell (Schileyko2018: 170, Fig. 1), D = 23.2 mm, A. Sysoev, photograph × 2 4 Morphology of the genital organs of “Bellatchia pseudomiana” sensu Schileyko(2018), modified after Schileyko(2018).
**Included species.** *Helix breviseta* L. Pfeiffer, 1862, *Trachia penangensis* Stoliczka, 1873.

**Diagnosis.** Shell depressed globular, apex not sunken, hairs or hair scars cover the entire shell. Penis thickened, probably with penial verge (?) and a slender, relatively long penial caecum; epiphallus slender, shorter than penis; retractor muscle attached at the penis-epiphallus transition; flagellum short; vagina slender, shorter than penis; stalk of bursa copulatrix long, with thickened base and oval bursa (based on the drawings of Stoliczka 1873: plate 3, fig. 18 and Collinge 1903: plate 12, fig. 17.).

**Remarks.** The anatomy of the genital organs of *Helix (Trachia) malayana* Möllendorff, 1887 (= *Trichochloritis breviseta*; see Maassen 2001) was described by Collinge (1903), and that of *T. penangensis* is known from Stoliczka (1873), here re-drawn and provided in Fig. 8 (*penangensis*) and Fig. 9 (*breviseta*). Both species possess a penial caecum, which is here considered as a diagnostic trait for the genus. Without knowing the full anatomy, it is uncertain how many of the hairy *Chloritis*-like species of continental Asia belong to this group.

**Trichochloritis breviseta** (L. Pfeiffer, 1862)

Figs 5–7, 9, 10

*Helix breviseta* L. Pfeiffer, 1862: 41–42, pl. 5, figs 4–5.  
*Helix (Trachia) malayana* Möllendorff, 1887: 303.  
*Chloritis malayana* Möllendorff, 1891: 335, pl. 30, figs 6–6a.  
*Helix (Trachia) malayana*: Collinge 1903: 210, pl. 12, fig. 17.  
*Chloritis (Trichochloritis) malayana*: Pilsbry 1893: 274, pl. 51, figs 34, 35.  
*Chloritis breviseta* (and *Chloritis malayana*, which is considered a synonym): Maassen 2001: 120.  
*Trichochloritis breviseta*: Schileyko 2011: 47.  
*Chloritis breviseta*: Foon et al. 2017: 56, fig. 21C.

**Type specimens examined.** *breviseta*: syntype MNHN-IM-2000-1847, Siam, D: 22.1 mm, H: 12.9 mm; *malayana*: syntypes (2 shells) NHMUK 1891.3.17.3–4, Perak, leg. Hungerford.

**Additional specimens.** Perak, leg. Hungerford, NHMUK 1891.3.17.3–4 (2 shells of “malayana”); Larut, Malay Peninsula, NHMUK 1897.3.15.7 (1 shell of “malayana”); Malakka, Kelantan, Hochland v. Perak, coll. O. Möllendorff ex coll. H. Rolle ex coll. Waterstraat, SMF 8538/1 (“malayana”).

**Type locality.** “Siam” (*breviseta*); “Perak” [Perak state, Malaysia] (malayana).

**Diagnosis.** Shell depressed, unicoloured, yellowish, with permanent hairs; umbilicus funnel-shaped with a blunt peripheral angulation.

**Description.** Spire only slightly elevated, shell depressed, shell thin; last whorl bluntly angled, a subsutural furrow is present but insignificant; colour yellowish, spiral band missing; the 4.5 whorls separated by a rather shallow suture; protoconch consists of slightly more than 1.5 whorls, squamous, bears minute wrinkled hair scars; tel-
eoconch completely covered by a moderately dense pattern of hairs; bristles stiffy and durable and stick to the shell (their apical part breaks off, but a dark brown conical bristle cone is left making the surface of the shell quite rough); aperture subrectangular with only slightly oblique columella; peristome reflected and covered by a white lip; parietal region with very slight whitish, blunt lime layer, inconspicuous; columellar reflection small; umbilicus wide and funnel-shaped with a blunt peripheral keel.

**Measurements.** D = 22.9–24.1 mm; H = 12.9–14.7 mm (n = 4).

**Distribution.** Malaysia and Thailand

---

**Trichochloritis penangensis** (Stoliczka, 1873)

Figs 8, 11

*Trachia penangensis* Stoliczka, 1873: 24–26, pl. 3, figs 1, 18–20.

*Chloritis penangensis*: Foon et al. 2017: 56–57, fig. 21D.

**Type specimens.** The types should be in the Zoological Survey of India in Kolkata but were not found during a recent search (S.K. Sajan, pers. comm., December 2018). They were likewise not found in the NHM.
New insights in Trichochloritis Pilsbry, 1891

Type locality. “Penang”.

Remarks. “Chloritis penangensis has a much more globular shell with less expanded whorls compared to Chloritis breviseta which has more expanded (perpendicular to the axis) whorls and thus, “wider” looking shells. These characters appear consistent for each species across Peninsular Malaysia (based on conchological comparisons), although shell size varies within each species.” (Junn Kitt Foon, pers. comm., 01 Dec 2018). To illustrate these differences, we illustrated the shells of both species (Figs 10, 11).

Genus uncertain

*Chloritis (?) bifoveata* (Benson, 1856)
Figs 15–17

*Helix bifoveata* Benson, 1856: 251.

**Specimens examined.** Thailand: Krabi: Phanom Benja National Park, Huai To waterfall and surrounding rain forest, 120 m, 08°14’21”N, 098°54’52”E, 08°14’08”N, 098°55’12”E, leg. Hausdorf, 28.07.2010, ZMH 51997/2.

Remarks. For a detailed description of the shell refer to Sutcharit & Panha, 2010. Our data on the reproductive anatomy largely matches that of Sutcharit and Panha (2010), with the following two exceptions: the flagellum is relatively long and slender, and the penial verge is not irregularly shaped but conical and deeply grooved with the folds starting from the epiphallus.

*Trichochloritis (?) pseudomiara* (Bavay & Dautzenberg, 1909)
Fig. 12

*Helix (Chloritis) pseudomiara* Bavay & Dautzenberg, 1909a: 236; Bavay and Dautzenberg 1909b: 181, pl. VI, figs 5–8.
*Trachia pseudomiara*: Schileyko2011: 45.

**Type specimens examined.** syntype MNHN-IM-2000-31774, Nat Son, leg. Messager, D: 24.3 mm, H: 13.3 mm.

**Other specimens examined.** Muong-Hum, RBINS/1; Muong-Hum, leg. Messager 1908, RBINS/1; Tonkin, Phong-Tho, RBINS/1 (mixed sample with *Trichochloritis* sp.); Nat-Son, RBINS/3 (mixed sample with *Trichochloritis* sp.); Tonkin, leg. Messager, RBINS/22 (some of them are juveniles); Tonkin, Phong-Tho, NHMUK 1909.7.9.57/1 (photographed for the North Vietnamese Land Snail Guide); Tonkin, Muong-Hum, MNHN-IM-2012-27105/2; Vietnam, Cam Duong, MNHN-IM-2012-27106/2
(probably erroneous locality?); Tonkin, Phong-Tho, MNHN-IM-2012-27107/2; Tonkin, Muong-Hum, MNHN-IM-2012-27108/2; Tonkin, Muong-Hum, leg. Messager, MNHN-IM-2012-27109/2; Tonkin, MNHN-IM-2012-27110/1; Haut Tonkin, MNHN-IM-2012-27111/1.

**Type locality.** Vietnam, N Vietnam: Nat Son.

**Diagnosis.** A rather large, usually dark species with rounded body whorl, fine radial growth lines and deep hair scars; umbilicus open, only a small part of it is covered by the columellar reflection.

**Description.** Shell rather large, almost flat, with relatively thick wall; body whorl rounded; last half whorl with or without very shallow subsutural furrow; the 4.75–5.25 whorls are separated by a shallow suture; colour greyish yellowish, or brown to olive green; protoconch consists of 1.5 whorls, finely granulate, with fine radial lines near the suture of the last half whorl; teleoconch finely, irregularly wrinkled, and covered with very deep hair scars, which are visible to the naked eye as well on the body whorl; hairs not permanent, although we did not have access to live collected specimens; aperture ovoid; peristome expanded and slightly reflected, and reinforced by a thickened whitish/light brown lip; parietal region with an inconspicuous layer, which is often darker than the rest of the shell; umbilicus widely open, concave and funnel-shaped, slightly covered by reflected peristome.

**Measurements.** D = 21.3–26.0 mm, H = 11.8–14.4 mm (n = 3).

**Distribution.** This species is known only from the northernmost part of Vietnam, along the Chinese border.

**Remarks.** This species can easily be identified based on the dark green-coloured shell and the deep, widely spaced hair scars that cover the entire teleoconch.

---

**Genus Dentichloritis gen. nov.**

http://zoobank.org/16A52E49-1C90-47D6-B66A-56F12C02B11A

*Trichochloritis:* Schileyko, 2007: 2113–2114, fig. 2032a–c (partim).

**Type species.** *Helix brevidens* Sowerby I, 1841: 25 (Puerto Galero, Philippines).

**Diagnosis.** Shell depressed globular, apex not sunken, hairs or hair scars cover the entire shell, aperture with a basal denticle. Penis very thick-walled, with narrow lumen, internally with very large conic tubercles in main chamber; flagellum and epiphallus absent; vas deferens passes gradually enlarging into penis; retractor muscle inserts at curvature of vas deferens close to its joint with penis; penial sheath thin, surrounds upper two third part of penis; vagina shorter than penis, thick.

**Etymology.** The name *Dentichloritis* refers to the presence of a denticle on the basal peristomal lip and the conchological similarity to *Chloritis*.

**Remarks.** There are seven *Trichochloritis* species known from the Philippines (Richardson 1985), and four of them have been photographed by Zilch (1966). They differ from *D. brevidens* in the open umbilicus and the lack of denticle on the basal lip. Therefore, we retain them in *Trichochloritis* until ethanol-preserved specimens become available.
Dentichloritis brevidens (Sowerby I, 1841)
Figs 13–14

Helix brevidens Sowerby I, 1841: 25.
Trichochloritis brevidens: Schileyko2007: 2113–2114, fig. 2032b, c.

Type specimens examined. Philippines, m.c. (Museum Cuming), 3 syntypes NHMUK 20190452 (D of photographed shell = 19.5 mm [Fig. 13]).

Type locality. Philippines, Puerto Galero (Municipality of Puerto Galera, municipality in the province of Oriental Mindoro).

Diagnosis. A middle-sized, yellowish species with a slender reddish peripheral belt, short hairs on the entire shell, nearly closed umbilicus (only visible in oblique view), and a slight thickening (dentine) on the basal part of peristome.

Description. Shell medium sized, depressed globular; body whorl rounded with slight indication of a blunt shoulder; last quarter to half whorl with a very shallow subsutural furrow; the 3.75–4 whorls are separated by a shallow suture; colour yellowish to ochre with a reddish slender belt above shoulder (midpoint of body whorl); protoconch consists of 1.5–1.75 whorls, finely granulate, with fine radial wrinkles; teleoconch covered by short hairs or hair scars, which are visible to the naked eye as well; aperture semilunar; peristome expanded and slightly reflected, and reinforced by a thickened whitish brown lip; a slight swelling (dentine) visible on basal part of peristome, between the midpoint of the basal peristome and the columella; parietal region with an inconspicuous layer, which is matter than the rest of the shell; umbilicus nearly closed by columellar reflection, visible only by oblique view.

Anatomy: Penis very thick-walled, with narrow lumen, internally with short plicae in basal part and very large conic tubercles in main chamber; flagellum and epiphallus absent; vas deferens rather long, evenly thin down to atrium; approximately one third way up it is attached to penis, and after penis is enlarged and fusiform, then in becomes very thin, thread-like, forming a sharp curvature and passes to penis, gradually enlarging; penial retractor attached to curvature of vas deferens and continues as a fine membrane down to middle part of penis; penial sheath thin, surrounds upper two third part of penis. Vagina shorter than penis, thick; spermatheca without visible division to stalk and reservoir, not attending albumen gland and provided with apical ligament (based on Schileyko2007: 2113–2114, fig. 2032b, c).

Discussion

Based on an anatomically examined specimen from southern Vietnam identified as Helix pseudomiara Bavay & Dautzenberg, 1909, Schileyko(2018) described the genus Bellatrachia Schileyko, 2018. However, that specimen is clearly incorrectly identified. Schileyko’s (2018) specimen has a rounded aperture and fine hair scars with fine silky periostracum. Thus, it closely resembles Helix condoriana Crosse & Fischer, 1863, also known from southern Vietnam. In contrast, the true Helix pseudomiara is known
Figures 15–17. *Chloritis (?) bifoveata* 15 shell of dissected specimens of *Chloritis bifoveata* (Thailand: Krabi: Phanom Benja National Park, ZMH 51997) 16 Situs of its genital organs 17 Penial verge of *Chloritis bifoveata*. A: verge visible from penis lumen; B: starting to penial verge from epiphallus; C: epiphallus opened until penial verge. Scale bar 1 mm.
only from northern Vietnam, and its shell has characteristic deep and sparsely arranged hair scars. Furthermore, the aperture of the latter is rather oval, not rounded. The reproductive anatomy of type species of *Trichochloritis* Pilsbry, 1891, *Trichochloritis breviseta* (L. Pfeiffer, 1862), was described by Collinge (1903). Although it is not sufficiently detailed (i.e., the inner structure of penis is unknown), it is useful enough to diagnose *Trichochloritis*. The anatomy of *Trichochloritis penangensis* (Stoliczka, 1873) was described in the original generic description, and it largely matches with that of *T. breviseta*. Schileyko (2007) described the genitalia of *Trichochloritis brevidens* (Sowerby I, 1841), originally described from Mindoro Island, the Philippines, as a representative of *Trichochloritis*. The reproductive anatomy of that species, however, differs from those of continental (true) *Trichochloritis* in several important characters. Therefore a new genus, *Denticloritis* gen. nov. is erected for *T. brevidens*. The largely different anatomy, together with biogeographical reasons, suggest that *Trichochloritis* (continental Asia) and *Denticloritis* gen. nov. (Philippines) are probably not even closely related.

In the original description of *Trichochloritis*, Pilsbry (1891) claimed that the most closely related genus was *Planispira* Beck, 1837. The anatomy of the type species of that genus (*Helix zonaria* Linnaeus, 1758) was described by Schileyko (2003), and is distinguished from *Trichochloritis* at first sight by the absence of a penial caecum.

It is difficult to interpret the relationship of *Trichochloritis* with *Chloritis*, because the reproductive anatomy of the type species of the latter (*Helix ungulina* Linnaeus, 1758, by subsequent designation of Martens in Albers, 1860, from Ceram Island, Indonesia) is unknown. *Chloritis* is diagnosed conchologically mainly based on the sunken spire and the hairless shell (Schileyko 2003). Thus, the two continental species assigned to *Chloritis*, namely *Chloritis bifoveata* (Benson, 1856) and *Chloritis diplochone* Möllendorff, 1898, do not even fit due to their strongly hairy shells. It is very unlikely that the two species inhabiting Thailand and Malaysia would belong to the same group as a species from Ceram Island. However, we refrain from erecting a genus for *C. bifoveata* and *C. diplochone* until we have more information on the anatomy of *C. ungulina*.

**Acknowledgements**

We are grateful to Sigrid Hof, Ronald Janssen (SMF), Virginie Héros, Philippe Bouchet, Philippe Maestrati (MNHN), Jonathan Ablett (NHM), and Thierry Backeljau (RBINS) for offering access to their museum collections, to Bernhard Hausdorf (ZMH) for loaning specimens of *C. bifoveata*, to Herold Taylor, to Junn Kitt Foon for his information and photographs on *T. penangensis* and *T. breviseta*, to Sheikh K. Sajan (ZSI) for searching for the types of *T. penangensis*, to Yuri Kantor and Alexander Sysoev for sending high quality photographs of *Bellatrachia* cf. *condoriana*.
